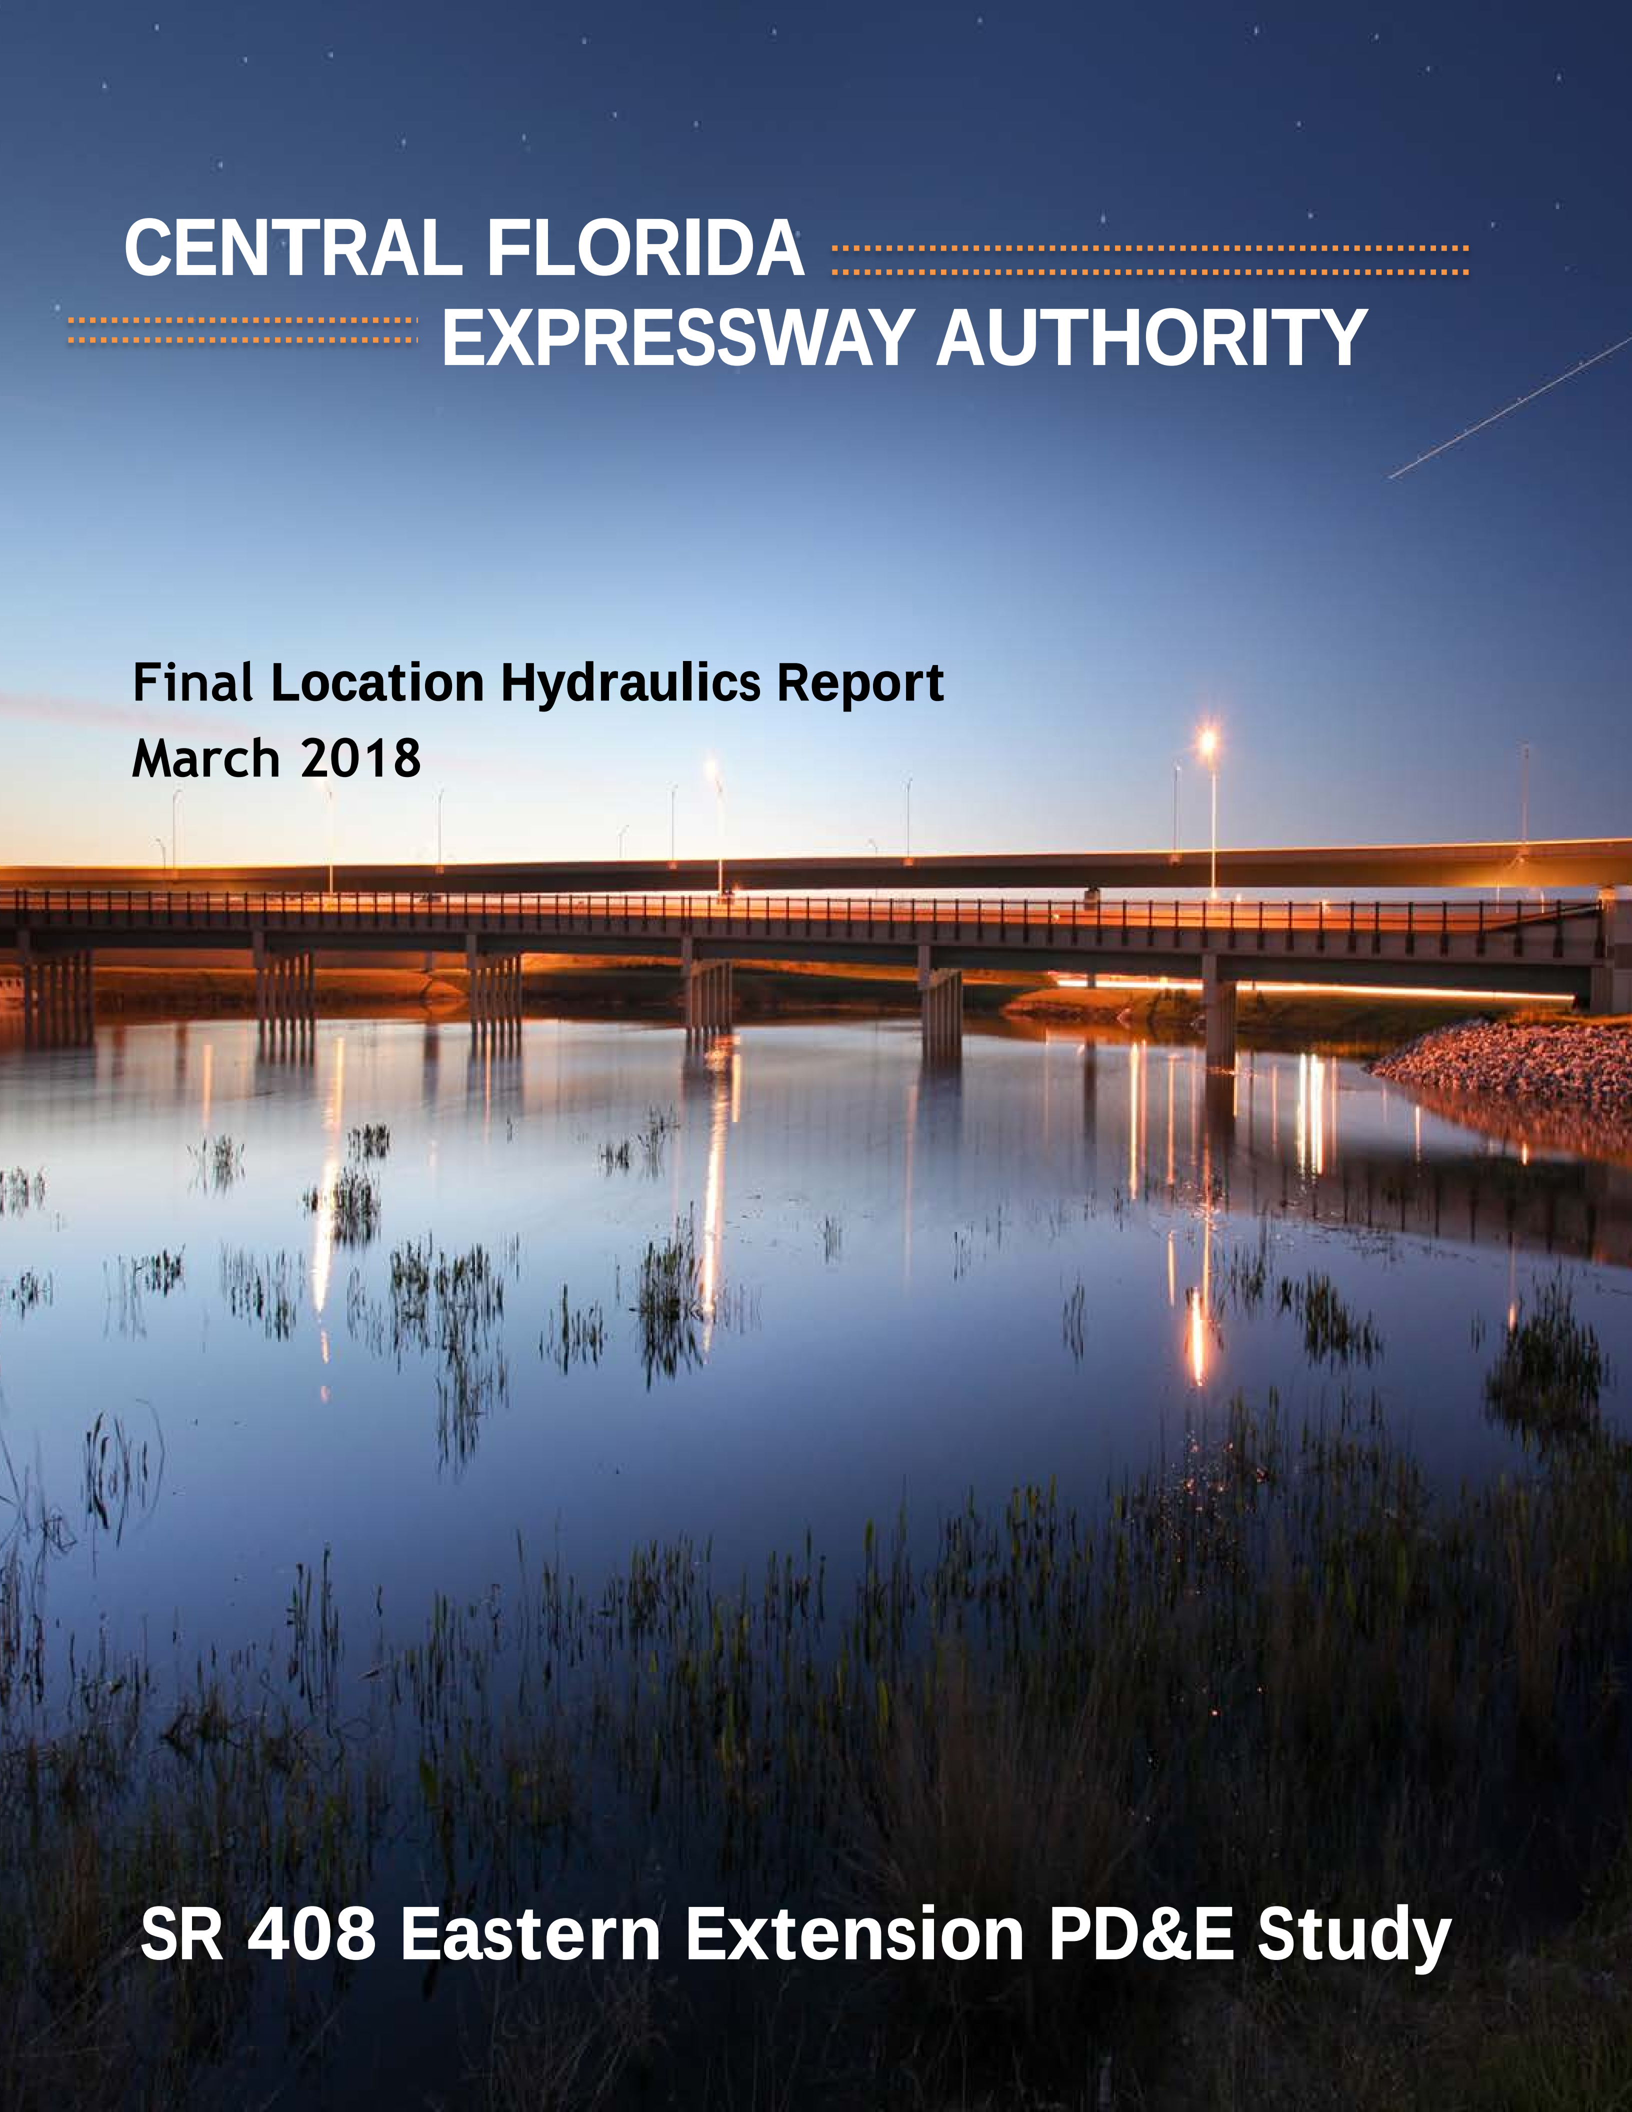
CENTRAL FLORIDA
EXPRESSWAY AUTHORITY

Final Location Hydraulics Report

March 2018



SR 408 Eastern Extension PD&E Study

PROFESSIONAL ENGINEER CERTIFICATE

I hereby certify that I am a registered professional engineer in the State of Florida practicing engineering with Metric Engineering, Inc. and I have reviewed or approved the evaluation, findings, opinions and conclusions as reported for:

PROJECT: **SR-408 Eastern Extension PD&E Study**

FINANCIAL PROJECT NUMBER: **CFX-Project No. 408-254**

LOCATION: **Orange County**

CLIENT: **Central Florida Expressway Authority**

This Draft Location Hydraulics Report (LHR) provides the results of a summary of data collection efforts, and limited calculation for the proposed cross drains and floodplain evaluations prepared for the conceptual analyses for the Project Development and Environment Study for SR-408 Eastern Extension project. I acknowledge that the procedures and references used to develop the results contained in this report are standard to the professional practice of hydrologic analysis and hydraulic engineering as applied through professional judgment and experience. This document is for planning purposes only and is not to replace any effort required for the final design.

EXECUTIVE SUMMARY

The purpose of the SR-408 Eastern Extension Project Development and Environment (PD&E) study is to develop a proposed improvement strategy that is technically sound, environmentally sensitive and publicly acceptable. As with every PD&E Study, emphasis has been placed on the development, evaluation and documentation of detailed engineering and environmental studies including data collection, conceptual design, environmental analyses, project documentation and the preparation of a Location Hydraulics Report (LHR). The project is located in Orange County, Florida.

The Central Florida Expressway Authority (CFX) is presently evaluating the potential to expand SR-408 from its current eastern terminus at SR-50, locally known as East Colonial Drive, to SR-520 in northeast Orange County. This new seven-mile eastern extension of SR-408 would constitute the first stage towards providing a west-east high-speed corridor with future connectivity to I-95; enhancing safety, capacity and mobility for the region and CFX's customers. After a comprehensive evaluation process of various typical sections, horizontal alignment combinations, and public involvement efforts, a recommended alignment was selected.

The proposed SR-408 Eastern Extension project is divided into three segments based on the land use characteristics. Segment 1 is more urban in nature and exhibits a higher traffic demand than Segments 2 and 3. Segment 1 is from the beginning of the SR-50/SR-408 interchange to Avalon Park Boulevard. Segments 2 and 3, beginning east of Avalon Park Boulevard to SR-520 at the east end of the study area, exhibit more of a rural tendency.

The purpose of this LHR is to identify and discuss the proposed cross drains throughout the project corridor. There are fourteen new cross drains identified for this project. The cross drains were sized appropriately using HY-8 program to minimize the impacts to flood elevations and limits of the floodplain. The cross drain analysis indicates the proposed structures will be able maintain hydraulic connectivity within the tributaries, wetlands or floodplains that the project crosses without significant increase in the existing flood elevation. Thus, the project will not affect existing flood heights or floodplain limits. This project will not cause significant change in the potential for interruption or termination of emergency service or emergency evacuation routes in the surrounding areas. Therefore, it has been determined that the encroachment due to the proposed roadway is not significant.

1.0 INTRODUCTION

The vision of this enhanced west-east corridor has been documented in prior concept studies prepared by CFX, including the SR-408 Eastern Extension Concept Development and Evaluation Study completed in 2008. The limits of this study generally extend from the current terminus of SR-408 at SR-50 to the vicinity of the SR-50/SR-520 intersection. The project location and vicinity are shown in **Appendix-A**. The proposed Typical Sections for Segment 1 and Segment 2/3 are provided in **Appendix-D**. The SR-408 Eastern Extension is one piece of Florida's Strategic transportation investments to support future growth and create connections between global trade activities, from the Orlando International Airport and the University of Central Florida to Cape Canaveral.

SR-50 is located within the project vicinity and is classified as a major arterial facility. SR-50 provides an important connectivity function between the east Orlando area to the west, and I-95 just south of Titusville to the east. As traffic continues to grow within the study area due to the projected development, it is essential to maintain adequate mobility for the region. A new expressway facility will not only improve mobility but significantly reduce the existing exposure to at-grade conflict points associated with traffic signals and local access issues. In summary, the proposed SR-408 Eastern Extension will greatly enhance Central Florida's regional expressway needs and provide the initial phase of the ultimate vision of an expressway connection from Orlando to I-95.

This report discusses and analyzes proposed cross drains throughout the project corridor. The proposed corridor impacts wetlands and floodplains, therefore the placement of cross drains is crucial to maintain the natural flow. A description of each proposed cross drain is located in Section 4.1 of this report. Exhibits showing proposed cross drains within wetlands and floodplains are in **Appendix-E**. Based on an assumed profile, the proposed culverts are shown along the existing ground based on a 1' contour tin file (**Appendix-F**).

2.0 CROSS DRAIN ANALYSIS METHODOLOGY AND DESIGN CRITERIA

The proposed project alignment is a new corridor. There are no existing cross drains along the proposed project corridor; therefore, the project will consist of all new cross drains. Cross drains were located strategically along the proposed SR-408 Eastern Extension corridor to maintain flow connectivity within the impacted wetlands, floodplains, and Econ River tributaries. There are a total of fourteen cross drains proposed along this new corridor. The flow rates for cross drains 1 through 4 were obtained from the Big Econ River Basin Stormwater Management Master Plan (**Appendix-I**). In accordance with the FDOT Drainage Design Guide for designing culverts, the Rational Method was used to conduct hydrologic analysis for cross drains 5 through 9. The Rational Method was used because the delineated drainage areas for each cross drain were less than 600 acres. Drainage areas were delineated by using a one foot Lidar contour map (St. Johns River Water Management District), existing drainage maps from SR-50 projects, and drainage maps from land development projects along the project corridor. The flow rates for cross drains 10 through 13 were obtained from the Bithlo Area Stormwater Management Master Plan (**Appendix-J**).

2.1 Contributing Flow Determination

Rational Method

- The Rational Method procedures require calculating a peak basin flow rate from the basin characteristics.
- The composite runoff coefficient was calculated based on the percentage of land use for residential, commercial, flat lawns, and woods/wetland areas per the FDOT Hydrology Handbook.
- Time of concentration was calculated using the TR-55 Method.
- The intensity for each storm event was calculated from the FDOT Intensity-Duration-Frequency (IDF) curve for Zone 7.
- The composite coefficient is only designed for a storm period of 10 years. Storm frequency factors were used to adjust the composite runoff coefficient for 25, 50, and 100 year storm events (**Appendix-H**, **Table B-5**).
- Frequency Factor for Return Period 500 year runoff coefficient is not provided in the FDOT Hydrology Handbook; therefore, a log-log graph was created in order to interpolate the peak discharge.
- The Rational Method should only be used for areas up to 600 acres.

2.2 Floodplains/Floodways Criteria

- The proposed project may not cause a net reduction in flood storage within the 10-year floodplain.
- Structures shall cause no more than a one-tenth (0.1) of a flood increase in the 100-year flood elevation 500-feet upstream.
- Proposed construction shall not cause a reduction in flood conveyance capabilities.
- Best Management Practices (BMP's) shall be employed to minimize velocity to avoid undue erosion.
- The design of encroachments shall be consistent with standards established by FEMA.

2.3 Culvert Design Criteria

The following criteria was drawn from the 2018 FDOT Drainage Manual. The following table provides the required storm events to be analyzed for each cross drain per the FDOT Drainage Manual and the FDOT Drainage Design Guide.

Table-1 Storm Frequency Criteria

Storm Event Frequency	Definitions
50-Year	Design Flood Event
100-Year	Base Flood Event
500-Year	Greatest Flood Event

- All cross drains, if applicable, shall be designed to have sufficient hydraulic capacity to convey the 50-year (Design Frequency) storm event. In accordance with the FDOT Drainage Manual, mainline interstate culverts should be designed for a frequency of 50 years (**Appendix-H**). All culverts shall be analyzed for the base flood (100 year).
- Backwater shall not significantly change land use values unless flood rights are purchased.
- The headwater for design frequency conditions shall be kept at or below the travel lanes.
- The highest tailwater elevation, which can reasonably be expected to occur coincident with the design storm event, shall be used (typically, crown of pipe is used at the outlet).
- The minimum culvert size is 18” or its equivalent size.
- The design of all cross culverts shall comply with the guidelines set forth in the FDOT Drainage Manual, Chapter 4.
- The flows and tailwater elevations used in this report are based on preliminary information. The culvert design will need to be reviewed for flows and tailwater elevations during the final design.

The criteria listed above was collected from the following applicable sources:

- FDOT Drainage Design Guide – Culvert Design (January 2018)
- FDOT Drainage Manual (January 2018)
- FHWA Code of Federal Regulation 23 CFR 650A
- SJRWMD Management and Storage of Surface Waters (MSSW) Permit Information Manual (October 2013)

2.4 Culvert Sizing

All cross drains were sized for a 100-year storm event even though the FDOT design criteria specifies a 50-year Design Frequency. The Big Econ River Basin Stormwater Management Master Plan and Bithlo Area Stormwater Management Master Plan only provided flows and stages for 5-year, 10-year, 25-year, and 100-year. The 50-year and 500-year flows were interpolated by a log-log graph. Since stages were not provided for the 50-year storm event, the 100-year flows and stages were used instead. The calculated 100-year backwater stage elevation from the HY-8 analysis was compared with the existing 100-year flood stage. Culvert trial sizes were determined by using the Manning’s Equation. The trial sizes were used to perform HY-8 analysis. While performing the overtopping analysis, the cross drains were appropriately sized to conform with the floodplain criteria in Section 2.2 of this report.

Manning's Equation

- The pipe length was measured from R/W to R/W for each cross drain.
- The change in flow line elevation from upstream to downstream was assumed to be 0.50 ft.
- Manning's "n" value of 0.012 was used.
- The 100-year flow rate for each cross drain was used.

HY-8

- The trial culvert size from the Manning's equation was used for the HY-8 analysis.
- The culvert size was adjusted to maintain backwater stage elevations below the 100-year stage elevation.
- The 10-year flow was the minimum flow, 50-year flow was the design flow, and 100-year flow was the maximum flow.
- The crown of the pipe/top of box culvert or existing SR-50 cross drain DHW elevations were used as the constant tailwater elevations.

3.0 EXISTING CONDITIONS

3.1 Soil Data

The NRCS Soil Survey of Orange County published by United States Department of Agriculture (USDA) has been reviewed for the project. The soil survey map and soil types found throughout the proposed corridor are shown in the complete NRCS USDA Soil Survey located in **Appendix-C**. In general, the superficial soils consist of fine sands, muck and poorly drained soil. The groundwater is at a depth of 0'-3.5' below the existing ground. Refer to **Table-2** below for the most occurring soils within the project area.

Table-2 USDA NRCS Soil Survey Information

Soil No.	Orange County USDA Soil Name	Depth to Water Table (inches)	Hydrologic Soil Group
3	Basinger Fine Sand	0	A/D
15	Felda Fine Sand	0 to 6	A/D
20	Immokalee Fine Sand	6 to 12	B/D
34	Pomello Fine Sand	24 to 42	A
37	St. Johns Fine Sand	6 to 12	B/D
42	Sanibel Muck	0	A/D
44	Smyrna-Smyrna, Wet, Fine Sand	6 to 18	A/D
51	Wabasso Fine Sand	6 to 18	B/D
53	Wauberg Fine Sand	0 to 6	D
54	Zolfo Fine Sand	24 to 42	A

3.2 Land Use

The existing land use along the proposed SR-408 Eastern Extension corridor consists mostly of residential developments, commercial properties, and undeveloped areas. The residential areas consist of both multi-family and single-family residences. There are a few commercial properties along the proposed corridor as well. The undeveloped areas are mostly wetlands and upland forests with conservation easements. Please refer to **Appendix-A** for a Land Use map.

3.3 Existing Cross Drains

Considering this is a new alignment, there are not any existing cross drains or bridge structures for review. However, existing cross drains upstream and downstream of the proposed alignment were taken into consideration to maintain functionality and to verify the recommended improvements do not adversely impact the overall drainage function. Refer to **Table-3** for existing SR-50 cross drain information. The SR-50 Straight Line Diagram is in **Appendix-N** and identifies each SR-50 cross drain**.** The culvert size and 50-Year DHW elevations were obtained from the construction plans in **Appendix-P**, **Appendix-Q**, and **Appendix-R**. There is no evidence of scour or sedimentation of any existing cross drains along SR-50. Refer to **Appendix-S** for photos of the existing SR-50 cross drains.

Table-3 Existing SR-50 Cross Drain General Information

SR-50 CD-11	1-24" RCP	61.60	1960

4.0 PROPOSED CONDITIONS

The project corridor will cross through residential homes, commercial businesses, wetlands, wooded areas, and Econ River tributaries. Most tributaries west of the Econ River which cross the proposed SR-408 Eastern Extension corridor flow north and eventually into the Econ River. There is one slough, where UCF is located north of SR-50, which flows south into one of the Econ River tributaries and ultimately flows north to the Econ River. All tributaries east of the Econ River, which cross the proposed SR-408 Eastern Extension corridor, flow south and ultimately flow into the Econ River. Refer to the Drainage Basin Map located on **Page-17**.

4.1 Proposed Cross Drains

The roadway geometry is limited in order to minimize impacts and meet the requirements for the proposed design speed. Different interchange layouts and considerations were made to provide alternative conceptual designs. Fourteen cross drain locations were selected once the alignment and the most effective interchange layouts were identified. The proposed cross drain locations were also chosen based on the natural flow of the land from the surrounding floodplains and wetlands. The proposed SR-408 Eastern Extension corridor will have floodplain impacts along most of the corridor. These floodplain impacts will be mitigated by routing this volume to the project's proposed storm water management facilities, and roadside swales. Refer to **Table-4** for calculated culvert size, flow direction, and floodplain status. Refer to **Table-5** for flood data and **Table-6** for 100-year flows, 100-year stage elevations, tailwater elevations, and backwater stage elevations. Refer to **Appendix-G** for proposed cross drain calculations and HY-8 analyses.

Table-4 Proposed SR-408 Cross Drain General Information

* The existing 100-year elevations from the sources listed below were converted from NGVD to NAVD by subtracting 1.1 ft.

[1] Big Econ Stormwater Management Master Plan (**Appendix-I**)

[2] Bithlo Area Stormwater Management Master Plan (**Appendix-J**)

[3] Waterford Trails Construction Plans from Harling Locklin & Associates, Inc. (**Appendix-L**)

** The flows and tailwater elevations used in this report are based on preliminary information. The culvert design will need to be reviewed for flows and tailwater elevations during the final design.

CD-1

The proposed alignment will impact wetlands; therefore, CD-1 was strategically placed to maintain the flow connectivity between wetlands and the Econ River tributary that flows south through proposed CD-2 and then north through proposed CD-3. The culvert will convey runoff from one side of the road to the other while replicating the natural flow of the tributary. The 50-Year DHW elevation of 50.04 ft from SR-50 CD-3 (**Table-3**) was used as the tailwater for this cross drain. The 100-year elevation of 52.70 ft and 100-year flow of 1322 cfs from the Big Econ River Basin Stormwater Management Master Plan (Model ID: BEWL015X, **Appendix-I**) were used to size this cross drain. The calculated backwater stage elevation of 52.45 ft from HY-8 analysis is less than the existing 100-year flood elevation of 52.70 ft. The proposed culvert sizes from the HY-8 analysis are 3-11’x5’ concrete box culverts.

CD-2

CD-2 was proposed in order to maintain flow connectivity of the existing slough, which drains from the north to the south into a tributary. The tributary flows north through proposed CD-3 and drains into the Econ River. The 50-Year DHW elevation of 50.04 ft from SR-50 CD-3 (**Table-3**) was used as the tailwater for this cross drain. The 100-year elevation of 52.70 ft and 100-year flow of 1690 cfs from the Big Econ River Basin Stormwater Management Master Plan (Model ID: BEWL020C, **Appendix-I**) were used to size this cross drain. The calculated backwater stage elevation of 52.41 ft from HY-8 analysis is less than the existing 100-year flood elevation of 52.70 ft. The proposed culvert sizes from the HY-8 analysis are 4-10’x5’ concrete box culverts.

CD-3

CD-3 maintains flow connectivity to a tributary, which flows north into the Econ River. The 50-Year DHW elevation of 50.04 ft from SR-50 CD-3 (**Table-3**) was used as the tailwater for this cross drain. The 100-year elevation of 52.70 ft and 100-year flow of 2000 cfs from the Big Econ River Basin Stormwater Management Master Plan (Model ID: BEWL030C, **Appendix-I**) were used to size this cross drain. The calculated backwater stage elevation of 52.51 ft from HY-8 analysis is less than the existing 100-year flood elevation of 52.70 ft. The proposed culvert sizes from the HY-8 analysis are 3-11’x7’ concrete box culverts.

CD-3A

The basin area is approximately 2.35 acres. A time of concentration of 10 minutes was assumed. The crown of the pipe was used as the tailwater. The DHW elevation of 58.00 ft was obtained from SJRWMD Permit 100527 (**Appendix-X**). The calculated backwater stage elevation of 57.95 ft from HY-8 analysis is less than the existing 100-year flood elevation of 58.00 ft; therefore. The 100-year flow of 7.69 cfs was calculated using the Rational Method. The proposed culvert size from the HY-8 analysis are 1-30” RCP. The culvert will convey runoff from the wetlands that are severed by the proposed corridor, which flows southeast to the tributary that flows north and drains into the Econ River.

CD-4

The culverts will maintain flow connectivity to a tributary, which flows north into the Econ River. The elevation from the top of the box culvert was used as the tailwater. The 100-year elevation of 53.70 ft and the 100-year flow of 496 cfs from the Big Econ River Basin Stormwater Management Master Plan (Model ID: BEBE195X, **Appendix-I**) were used to size this cross drain. The calculated backwater stage elevation of 52.95 ft from HY-8 analysis is less than the existing 100-year flood elevation of 53.70 ft. The proposed culvert sizes from the HY-8 analysis are 2-8'x4' concrete box culverts.

CD-5

The basin area is approximately 109.03 acres. A time of concentration of 1.39 hours was calculated for this basin area using the TR-55 method. The elevation from the top of the box culvert was used as the tailwater. The 100-year elevation of 53.04 ft was obtained from SJRWMD Permit 70394-1 (**Appendix-L**). The calculated backwater stage elevation of 52.46 ft from HY-8 analysis is less than the existing 100-year flood elevation of 53.04 ft. The 100-year flow of 312 cfs was calculated using the Rational Method. The proposed culvert sizes from the HY-8 analysis are 2-72" pipes. The culvert will convey runoff from the wetlands to the tributary which flows north and drains into the Econ River. There is forty-six feet of space from the edge of the proposed ramp to the right-of-way line; therefore, a by-pass swale can be constructed in order to provide flow connectivity from CD-5 to CD-6 (**Appendix-E, Page-E3**). In addition to the one foot contour map, two drainage maps (**Appendix-O** and **Appendix-R**) were used to determine the basin area.

CD-6

CD-6 will maintain flow connectivity between the wetlands that will be severed by the proposed SR-408 Eastern Extension alignment. The runoff from the wetlands flows north and drains into the Econ River. The basin area is approximately 119.01 acres. The time of concentration was calculated for this basin area using the TR-55 method. The total time of concentration for this basin area is 1.44 hours. The elevation from the top of the box culvert was used as the tailwater. The 100-year elevation of 53.04 ft was obtained from SJRWMD Permit 70394-1 (**Appendix-L**). The calculated backwater stage elevation of 52.91 ft from HY-8 analysis is less than the existing 100-year flood elevation of 53.04 ft. The 100-Year flow of 259 cfs was calculated using the Rational Method. The proposed culvert sizes from the HY-8 analysis are 2-72" pipes. There is forty-six feet of space from the edge of the proposed ramp to the right-of-way line; therefore, a by-pass swale can be constructed in order to provide flow connectivity from CD-5 to CD-6 (**Appendix-E, Page-E3**). In addition to the one foot contour map, a regional drainage map (**Appendix-O**) was used to determine to the basin area.

CD-7

CD-7 will provide flow connectivity between wetlands that will be severed by the proposed CR 419 (Chuluota Road) corridor. The runoff flows south through proposed CD-8 and drains into the Econ River. The basin area is approximately 77.95 acres. A time of concentration of 1.54 hours was calculated for this basin area using the TR-55 method. The crown of pipe was used as the tailwater. The 100-year elevation of 63.56 ft was obtained from SJRWMD Permit #27625-4 (**Appendix-M**). The calculated backwater stage elevation of 63.17 ft from HY-8 analysis is less than the existing 100-year flood elevation of 63.56 ft. The 100-year flow of 231 cfs was calculated using the Rational Method. The proposed culvert sizes from the HY-8 analysis are 2-48” RCP. A one foot contour map was used to delineate the basin area for this cross drain. This basin area consists of single-family residential homes, several commercial businesses located on SR-50, several ponds, and woodland areas.

CD-8

The culvert will convey runoff from the severed wetlands to the tributary which flows south and drains into the Econ River. The total basin area for CD-8 is 121.44 acres and consists of two basin areas, which includes the basin area for CD-7. The time of concentration was calculated for this basin area using the TR-55 method. The total time of concentration calculated for this basin area is 1.68 hours. The elevation from the top of the box culvert used as the tailwater. The 100-year elevation of 55.03 ft was averaged from two 100-year elevations of 63.56 ft from existing Pond 200 and 46.50 ft from existing Pond 100 (SJRWMD Permit #27625-4, **Appendix-M**). CD-8 is located between existing Pond 200 and existing Pond 100. The calculated backwater stage elevation of 54.96 ft from HY-8 analysis is less than the existing 100-year flood elevation of 55.03 ft. The 100-year flow of 309 cfs was calculated using the Rational Method. The proposed culvert size from the HY-8 analysis is a single 10’x5’ concrete box culvert. A one foot contour map was used to delineate the basin area for this cross drain. This basin area consists of single-family residential homes, several commercial businesses located on SR-50, several ponds, and woodland areas.

CD-9

The basin area is approximately 75.82 acres. A time of concentration of 1.66 hours was calculated for this basin area using the TR-55 method. The calculated flow rate for a 100-year storm event is 212 cfs. The 100-year flood elevation of 45.00 ft was obtained from the FEMA Flood Map (**Appendix-B**). The top of the box culvert was used as the tailwater for this culvert. The calculated backwater stage elevation of 44.45 ft from HY-8 analysis is less than the existing 100-year flood elevation of 45.00 ft. The proposed culvert size from the HY-8 analysis is a single 72” RCP. The culvert will convey runoff from the wetlands to the tributary which flows south and drains into the Econ River. A one foot contour map was used to delineate the basin area for this cross drain.

CD-10

CD-10 will maintain flow connectivity from Channel E that flows south into the Econ River. The proposed alignment interrupts the natural flow of Channel E; therefore, culverts will be strategically placed where the proposed corridor and the channel intersect. The elevation from the top of the box culvert was used as the tailwater. The 100-year stage elevation of 45.40 ft and 100-Year flow of 398 cfs for Channel E (Node ID: NE-020, **Appendix-J**) from the Bithlo Area Stormwater Management Master Plan were used to size this cross drain. The calculated backwater stage elevation of 44.69 ft from HY-8 analysis is less than the existing 100-year flood elevation of 45.40 ft. The proposed culvert sizes from the HY-8 analysis are 2-6'x4' concrete box culverts.

CD-11

CD-11 will provide flow connectivity between a wetland and Channel K that will be severed by the proposed SR-408 Eastern Extension corridor. The proposed cross drain location is on an existing wetland that is east of CR13. The crown of pipe was used as the tailwater. The proposed location of CD-11 lies directly on a Wetland East of CR13 (Node ID: NK-130, **Appendix-J**) from the Bithlo Area Stormwater Management Master Plan. The wetland has a 100-year stage elevation of 59.50 ft and a 100-year flow of 24 cfs, which were used to size this cross drain. The calculated backwater stage elevation of 59.28 ft from HY-8 analysis is less than the existing 100-year flood elevation of 59.50 ft. The proposed culvert sizes from the HY-8 analysis are 2-24" pipes.

CD-12

The new alignment interrupts the natural flow of Channel KE. To maintain the natural flow connectivity of Channel KE, concrete box culverts will be strategically placed where the proposed roadway and channel intersect. The culverts will convey runoff from one side of the road to the other as it flows south towards the Econ River. The elevation from the top of the box culvert was used as the tailwater. The 100-year stage elevation of 55.50 ft and 100-Year flow of 409 cfs for Channel KE (Node ID: NKE-080, **Appendix-J**) from the Bithlo Area Stormwater Management Master Plan were used to size this cross drain. The calculated backwater stage elevation of 54.89 ft from HY-8 analysis is less than the existing 100-year flood elevation of 55.50 ft. The proposed culvert sizes from the HY-8 analysis are 2-8'x4' concrete box culverts. The existing upstream pipe size is a single 10'x4' concrete box culvert, therefore, the calculated culvert sizes of 2-8'x4' CBC are larger than the existing upstream culvert and will not restrict flow.

CD-13

The new alignment interrupts the natural flow of Channel M. To maintain the natural flow of Channel M, CD-13 will be strategically placed where the proposed roadway and channel intersect. This pipe will convey runoff from Channel M to the existing pond M-1. The crown of pipe was used as the tailwater. The 100-year stage elevation of 57.10 ft and 100-Year flow of 51 cfs for Channel M (Node ID: NM-070, **Appendix-J**) from the Bithlo Area Stormwater Management Master Plan were used to size this cross drain. The calculated backwater stage elevation of 56.73 ft from HY-8 analysis is less than the existing 100-year flood elevation of 57.10 ft. The proposed culvert size from HY-8 is a single 48" pipe. Pond M-1 will also be modified due to the proposed alignment. Please refer to **Appendix-K** for oversized drawings of pond M-1.

4.2 Floodplain Impacts

The project will impact the 100-year floodplain in three different ways:

1) Longitudinal roadway widening impacts resulting from filling the floodplain areas associated with Econ River and its tributaries.
2) Impact due to proposed pond locations in floodplain.
3) Impact due to proposed cross drains in floodplain.

The longitudinal impact due to the recommended SR-408 Eastern Extension alignment cannot be avoided. During the final design phase of the project, every effort should be taken to minimize floodplain impacts. During the design phase, floodplain impacts should be mitigated by routing to proposed stormwater management facilities and roadside swales. Also, a Bridge Hydraulics Report (BHR) will be prepared during the design phase to document the hydraulic impacts of the recommended SR-408 Eastern Extension alignment.

The FEMA's Flood Insurance Rate Map (FIRM) for Orange County shows that a portion of the project lies within the 100-year floodplain areas Zone AE (100 year Base flood elevations are provided) and Zone A (100 year base flood elevations are not provided, areas with 1% change of flooding) . Most of the project lies within flood Zone X (Areas of minimal flood hazard and above the 500-year flood zone). FEMA Map No. 12095C0280F, 129095C0285F, 12095C0295F and 12095C0315F, provide flood information for the project. Floodplain impact will occur throughout the project corridor and includes the Econ River and its tributaries. Please refer to **Appendix-A** for a FEMA exhibit and **Appendix-B** for a FEMA Flood Insurance Rate Map.

The total floodplain impact due to roadway fill for the entire proposed project corridor is 100.28 ac-ft. Available compensation in the proposed stormwater ponds and floodplain compensation ponds are 107.47 ac-ft. Please refer to Table-7 in the PSR for a summary of floodplain impacts and compensation. The dredge and fill volume are based on limited information available during the PD&E study. A detail evaluation has to be done during the final design. Based on the preliminary evaluation the project will provide more floodplain compensation than the impact. Therefore, a cup for cup compensation is provided by the project.

Two floodplain compensation pond sites were identified for this project in Basin 11C. The pond sites are Pond 11C3 and Pond 11C4. Both Pond 11C3 and Pond 11C4 are selected as the recommended floodplain compensation ponds. Beside this two floodplain compensation ponds, several stormwater ponds located adjacent to floodplains will also provide floodplain compensation. Please refer to Table-7 in the PSR. At certain segments of the project, for example at Basin 11C, the roadway profile is low enough to provide floodplain compensation in the swales; this option should be evaluated during the design phase.

Runoff from within the corridor will be collected and conveyed to stormwater management facilities; therefore, reducing the overall impact to the remaining floodplains. The preliminary hydraulic evaluation indicates the flood elevation and limits will not change significantly; therefore, it is assumed that the project will not have a significant impact and the encroachment will be minimal.

4.3 Project Classification

The floodplain is in a medium density, semi-urbanized area and the encroachments are classified as “minimal”. Minimal encroachment of a floodplain occurs when there is floodplain involvement, but the impacts on human life, transportation facilities, and natural and beneficial floodplain values are not significant and can be resolved with minimal efforts. Normally, these minimal efforts to address the impacts will consist of applying the FDOT drainage design standards and following the Water Management procedures to achieve results that will not increase or significantly change the flood elevation and the floodplain limits.

4.4 Flooding History and Maintenance Concern

In a phone interview with FDOT maintenance staff at the Oviedo Operations Center on 7/8/2016; there are no areas of flooding concern along the SR-50 corridor. The staff member Mike Danos mentioned that there have been no reports of flooding or overtopping within the SR-50 corridor. The proposed SR-408 Eastern Extension alignment is located just south of SR-50. Due to the close proximity of the proposed SR-408 Eastern Extension project to existing SR-50, flooding history of SR-50 will be used as a comparison for this project. Future investigation regarding flooding concerns at the proposed SR-408 Eastern Extension project corridor should be conducted during the final design.

5.0 BRIDGE HYDRAULICS EVALUATION

Bridges are proposed at the Econ River and at a major Econ River Tributary (Channel A) just east of the FPL Transmission Line (Sta. 660+00). Both proposed bridges will maintain flow conveyance in the Econ River and its major tributary. Bridge Hydraulic Reports for these proposed bridges shall be prepared during the design phase. The proposed Econ River Bridge will span over the river without impacting the floodplain or wetland. Please refer to the Bridge Analysis Report for the determination of bridge length, span and the pier locations. There is minimal impact to the floodplain due to the bridge piers. Refer to the Drainage Basin Map on **Page-17**, Econ River Basin Map on **Page-18**, Floodplain and Wetland Exhibits in **Appendix-E**, and Bridge Profiles in **Appendix-F**. The flows and stages in **Table-7** for the Econ River Bridge were obtained from the Big Econ River Stormwater Management Master Plan (Model ID: BEBE160X, **Appendix-I**). The flows and stages in **Table-7** for the Econ River Tributary Bridge were obtained from the Bithlo

Area Stormwater Management Master Plan (Node ID: NA-060, **Appendix-J**). The Econ River Tributary Bridge will need to account for additional runoff from a small area between Station 649+50 to 651+00. It is assumed that the proposed bridge over the Econ River will not increase the flood stage or the flood limits. Minor floodplain impacts are anticipated due to the bridge pier placement. Overall, insignificant impacts are anticipated at the Econ River. During the design phase, a FEMA No-Rise Certification should be assessed.

Table-7 Proposed SR-408 Bridge Structure Information

Bridge Structure	100-Year Flow (cfs)	100-Year EL (ft)	Bridge Low Member EL (ft)	Existing Ground EL (ft)	Bridge Clearance (ft)	Bridge Length (ft)
Econ River	10360	42.20	74.41	31.00	42.20	3820
Econ River Tributary (Channel A)	697	48.30	63.41	40.00	16.87	300

6.0 CONCLUSION

The purpose of this report was to determine potential cross drain locations along the proposed SR-408 Eastern Extension project corridor to reduce impacts to floodplains and wetlands.The proposed alignment will cross through residences, commercial businesses, wetlands, Econ River tributaries, and wooded areas. These proposed cross drain locations were chosen based on maintaining the natural flow of the land from the surrounding floodplains, wetlands, and Econ River tributaries. Fourteen potential cross drains were selected and analyzed for this project. The 100-year flow rates for cross drains 1 through 4 were obtained from the Big Econ River Basin Stormwater Management Master Plan. The 100-year flow rates for cross drains 10 through 13 were obtained from the Bithlo Area Stormwater Management Master Plan. The Rational Method was used to determine the flow for cross drains 5 through 9. Each cross drain was designed for a 100-year storm event, in order to compare the 100-year backwater elevation with the 100-year existing flood elevation. Manning's Equation was used to determine trial sizes for each culvert. The trial sizes were used to perform the HY-8 analysis. The floodplains will be impacted due to longitudinal roadway widening and proposed pond locations. By following FDOT design standards and water management procedures, the proposed cross drains will have minimal impacts on the existing floodplains and wetlands. The purpose is to achieve results which do not increase or significantly change existing flood elevations or floodplain limits. The proposed cross drains located within floodplains will have minor volumetric impacts, and insignificant impact to flood stage and flood limits. The final design team should verify the proposed culvert sizes and their locations, based on the final roadway geometry and profile. BHR's for the Econ River Bridge and the Econ River Tributary Bridge should be provided during the design phase. The flows and tailwater elevations used in this report are based on preliminary information. The culvert design will need to be reviewed for flows and tailwater elevations during the final design.

FEMA Flood
Insurance Rate Map

possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was State Plane Florida East FIPS Zone 0901. The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3191

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242** or visit its website at http://www.ngs.noaa.gov/.

Base map information shown on this FIRM was provided in digital format by Orange County, Florida.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables *in the Flood Insurance Study report (which contains authoritative hydraulic data)* may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a *Flood Insurance Study report*, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://www.msc.fema.gov/.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/.

NGVD29 to NAVD88 Vertical Datum Conversion Table (feet)

Watershed Name	Minimum Conversion	Maximum Conversion	Average Conversion	Maximum Offset
Big Econlockhatchee River	-1.03	-1.15	-1.09	0.06
Boggy Creek	-0.91	-1.01	-0.96	0.05
Cypress Creek	-0.87	-0.91	-0.89	0.02
Howell Branch	-0.96	-1.05	-0.98	0.07

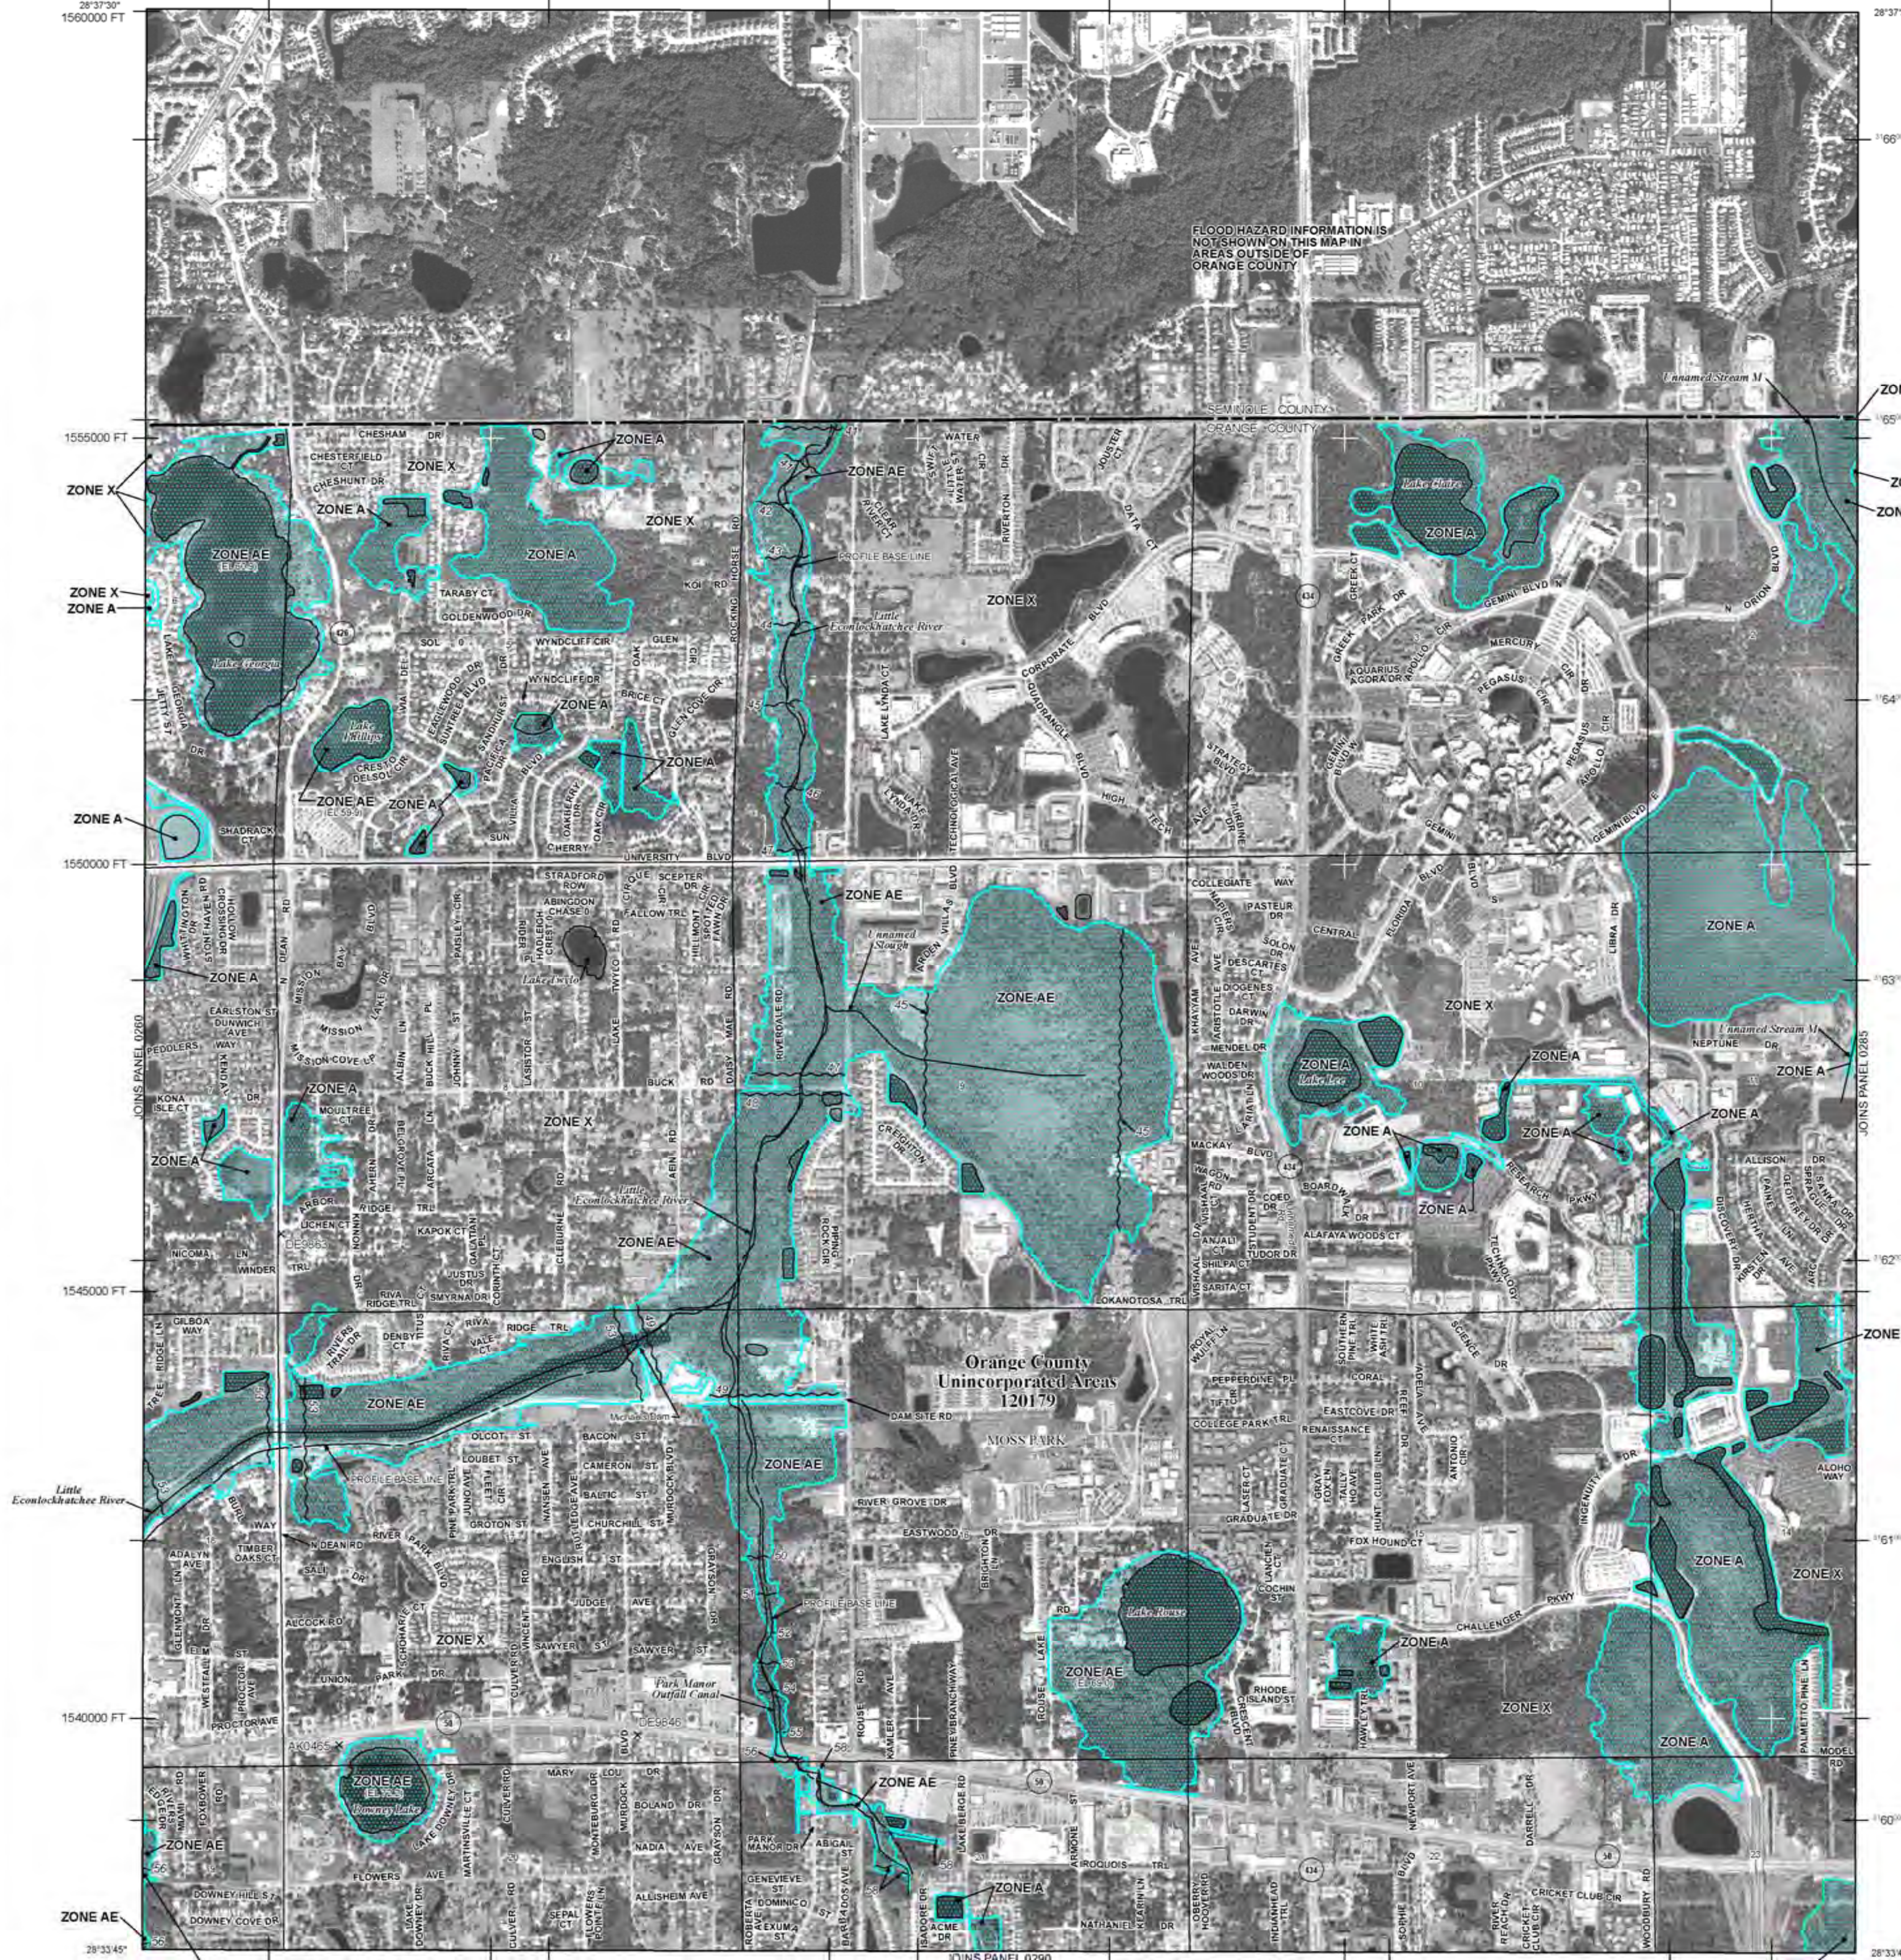
Wekiva River	-0.88	-1.01	-0.94	0.07



1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Areas to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X — Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X — Areas determined to be outside the 0.2% annual chance floodplain.

ZONE D — Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

1% annual chance floodplain boundary
0.2% annual chance floodplain boundary
Floodway boundary
Zone D boundary
CBRS and OPA boundary
Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.

513	Base Flood Elevation line and value; elevation in feet*
(EL 987)	Base Flood Elevation value where uniform within zone; elevation in feet*

* Referenced to the North American Vertical Datum of 1988 (NAVD 88)

A — A	Cross section line
23 - - - 23	Transect line
97°07'30", 32°22'30"	Geographic coordinates referenced to the North American Datum of 1983 (NAD 83), Western Hemisphere
4275000mE	1000-meter Universal Transverse Mercator grid ticks, zone 17
6000000 FT	5000-foot grid values: Florida State Plane coordinate system, East Zone (FIPSZONE = 901), Transverse Mercator projection

Notice to User: The **Map Number** shown below should be used when placing map orders; the **Community Number** shown above should be used on insurance applications for the subject community.

MAP NUMBER
12095C0280F

possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was State Plane Florida East FIPS Zone 0901. The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3191

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242** or visit its website at http://www.ngs.noaa.gov/.

Base map information shown on this FIRM was provided in digital format by Orange County, Florida.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables *in the Flood Insurance Study report (which contains authoritative hydraulic data)* may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a *Flood Insurance Study report*, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://www.msc.fema.gov/.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/.

NGVD29 to NAVD88 Vertical Datum Conversion Table (feet)

Watershed Name	Minimum Conversion	Maximum Conversion	Average Conversion	Maximum Offset
Big Econlockhatchee River	-1.03	-1.15	-1.09	0.06
Boggy Creek	-0.91	-1.01	-0.96	0.05
Cypress Creek	-0.87	-0.91	-0.89	0.02
Howell Branch	-0.96	-1.05	-0.98	0.07
Lake Apopka	-0.87	-0.97	-0.91	0.06
Lake Hart	-0.97	-1.07	-1.02	0.05
Little Econlockhatchee River	-0.92	-1.07	-1.01	0.09
Little Wekiva River	-0.91	-1.02	-0.95	0.07
Reedy Creek	-0.86	-0.89	-0.88	0.02

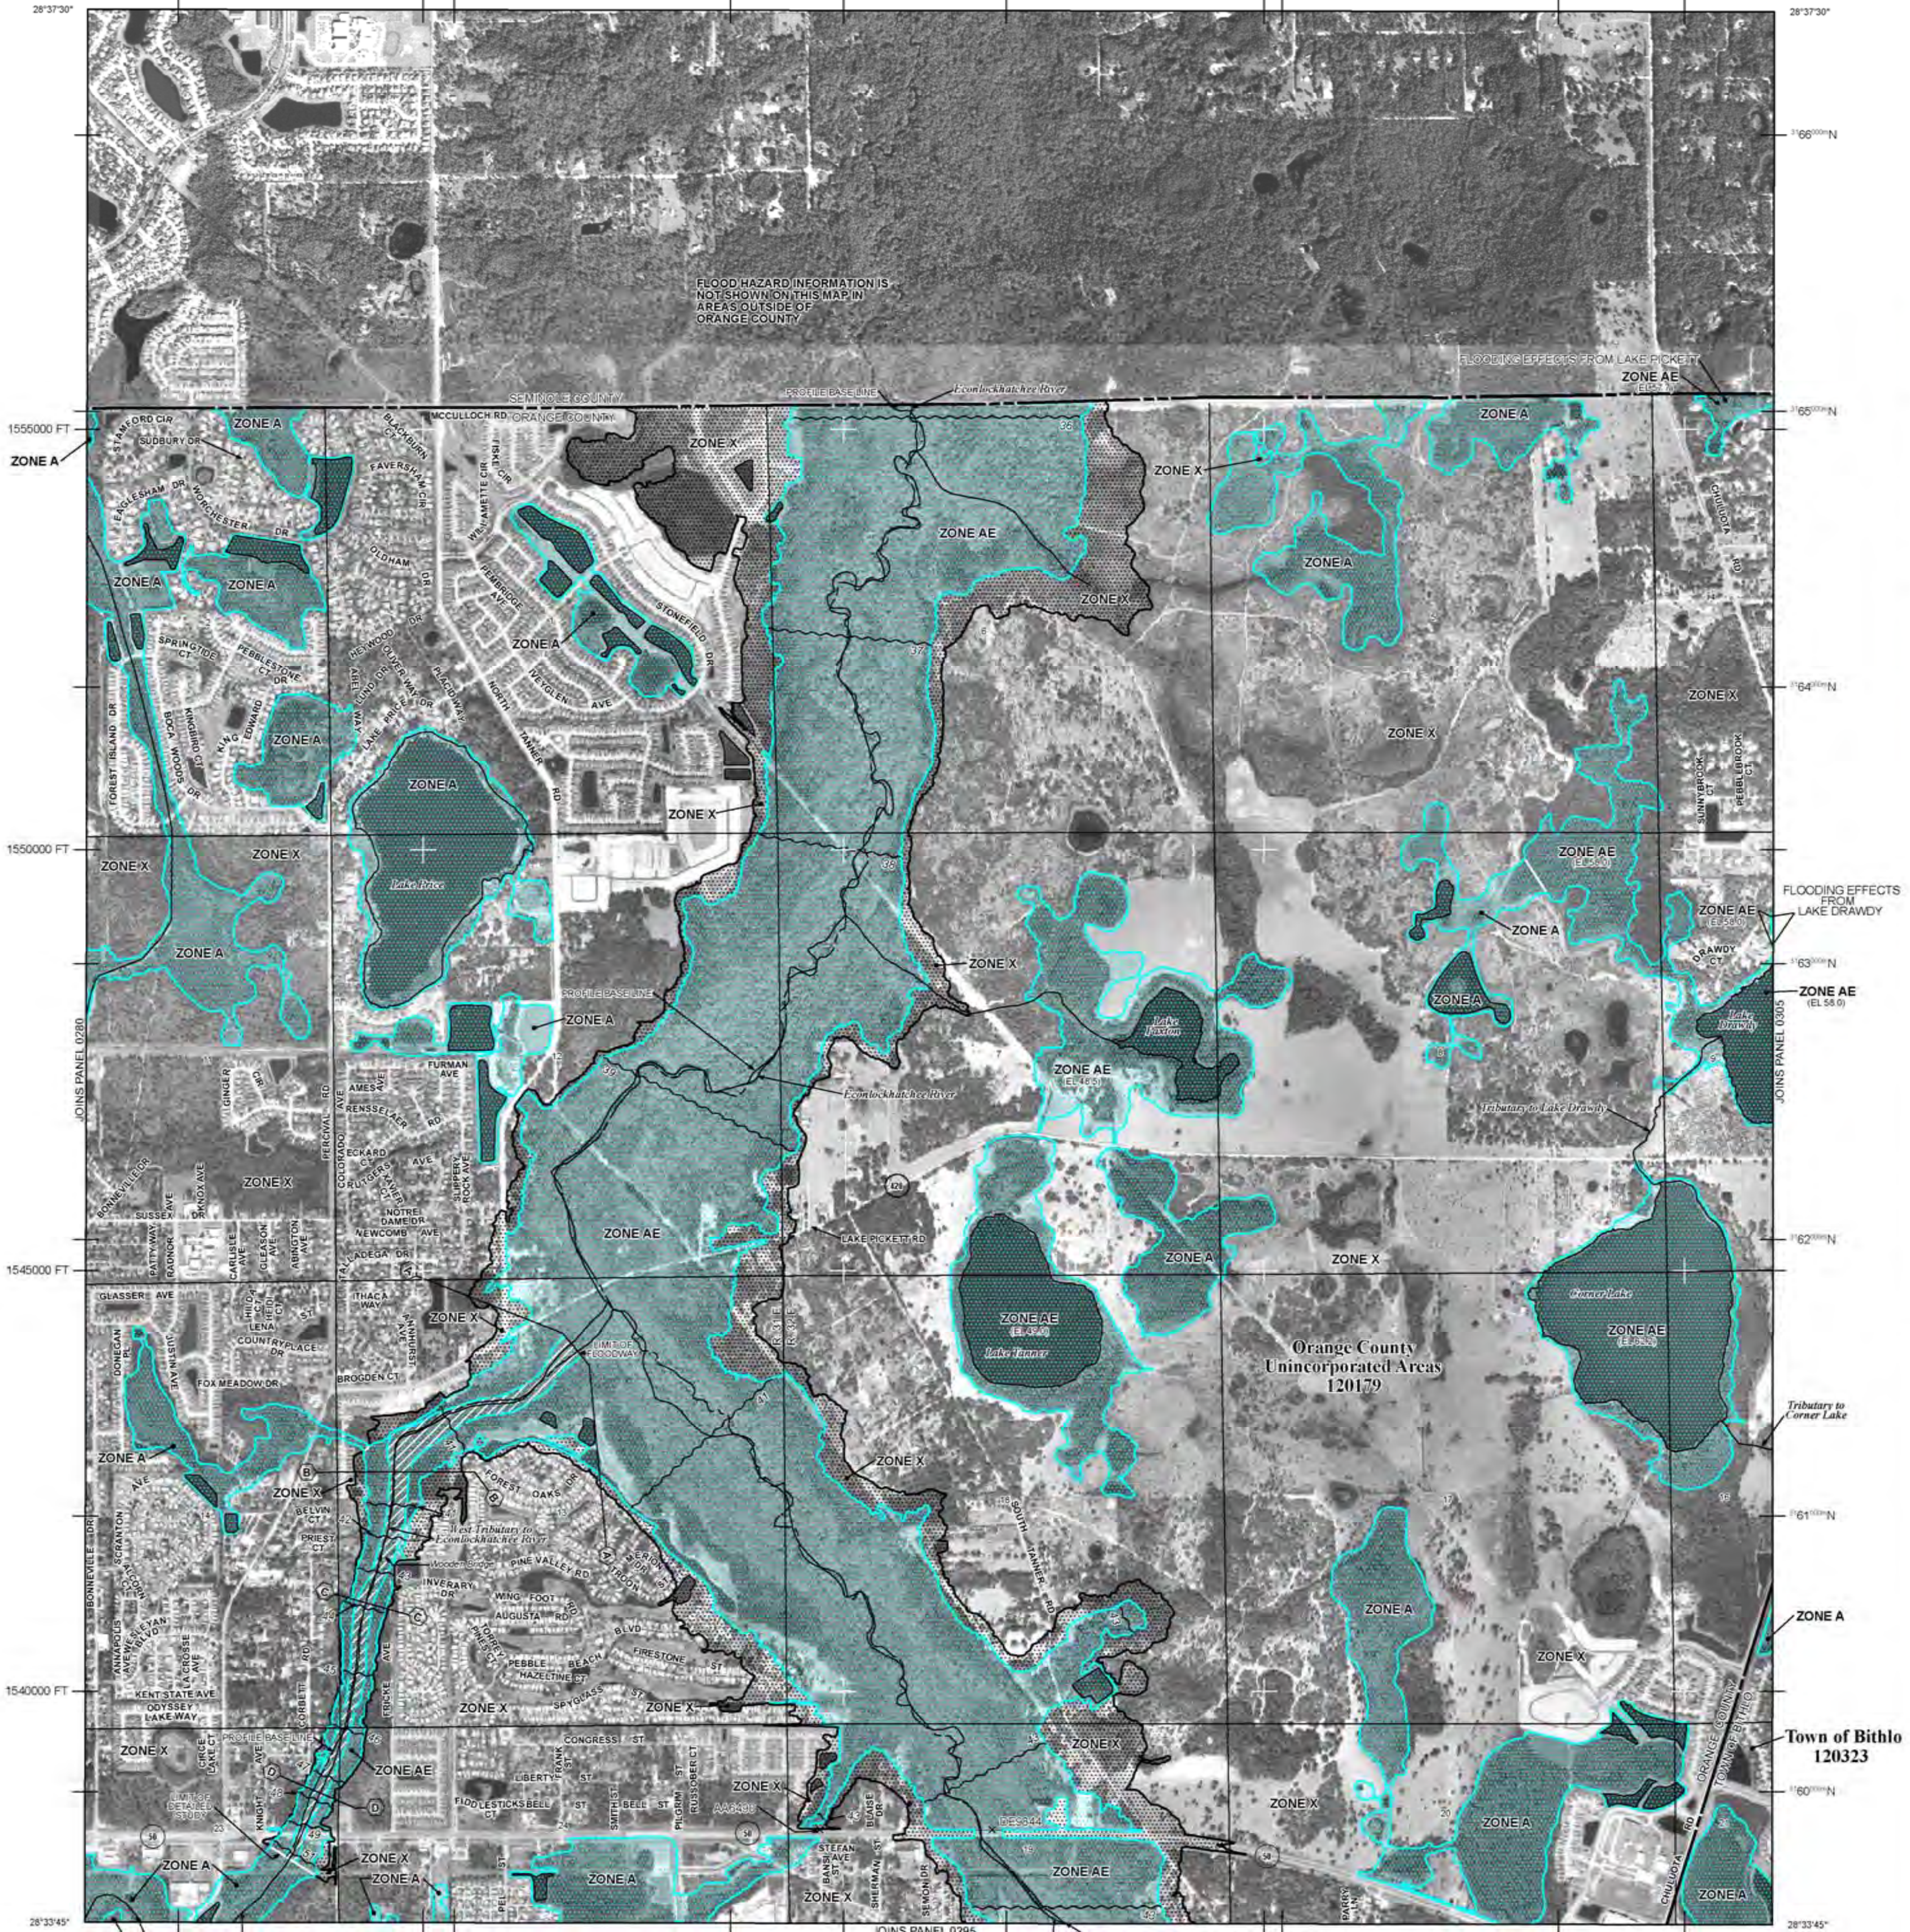
St. Johns River	-1.08	-1.33	-1.19	0.14
Wekiva River	-0.88	-1.01	-0.94	0.07



1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Areas to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X — Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X — Areas determined to be outside the 0.2% annual chance floodplain.

ZONE D — Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

1% annual chance floodplain boundary
0.2% annual chance floodplain boundary
Floodway boundary
Zone D boundary
CBRS and OPA boundary
Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.

513 — Base Flood Elevation line and value; elevation in feet*

(EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

* Referenced to the North American Vertical Datum of 1988 (NAVD 88)

A—A Cross section line

23- - -23 Transect line

97°07'30", 32°22'30" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83), Western Hemisphere

4275000mE — 1000-meter Universal Transverse Mercator grid ticks, zone 17

6000000 FT — 5000-foot grid values: Florida State Plane coordinate system, East Zone (FIPSZONE = 901), Transverse Mercator projection

DX5510 × — Bench mark (see explanation in Notes to Users section of this FIRM panel)

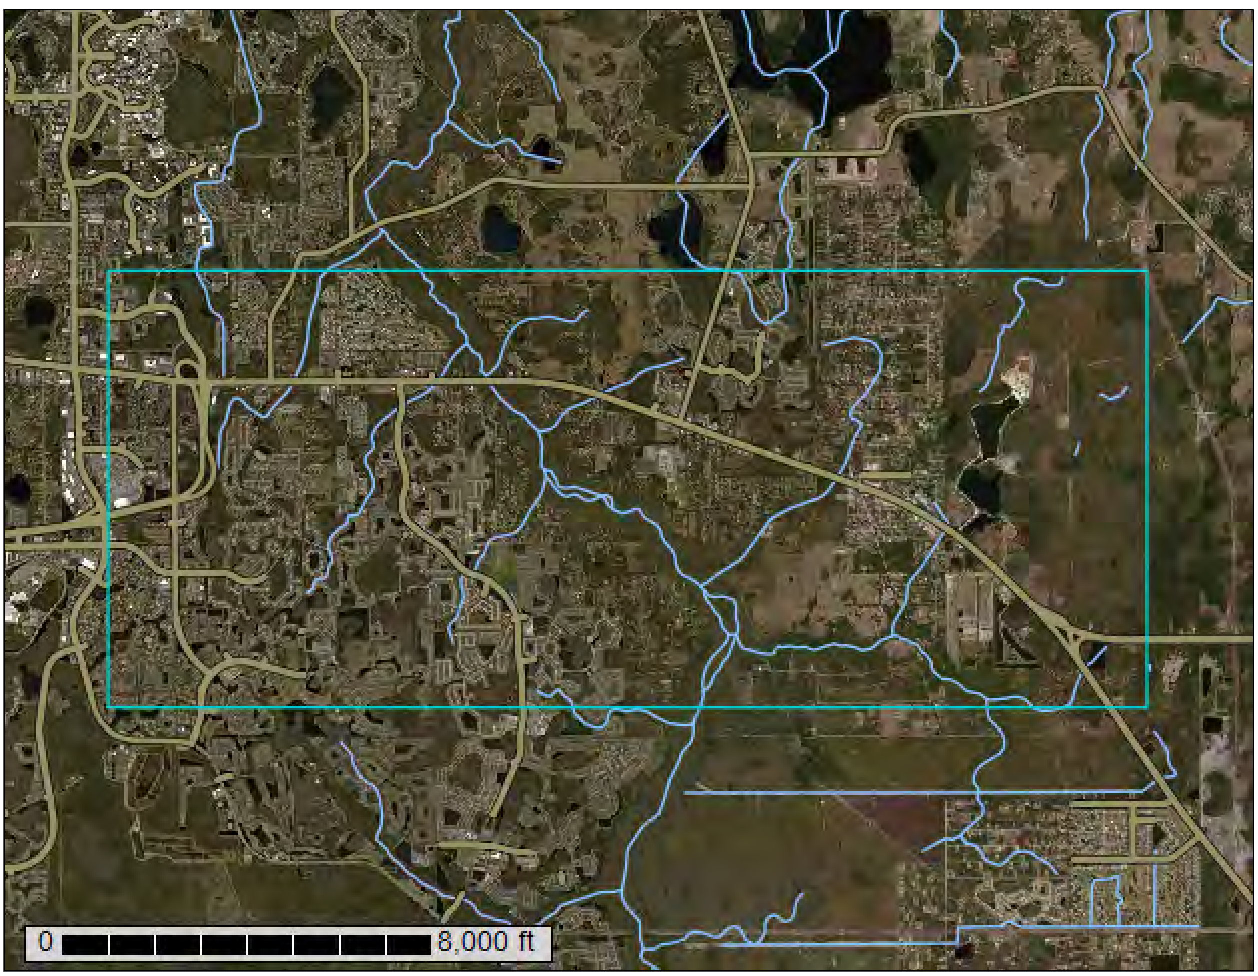
A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for

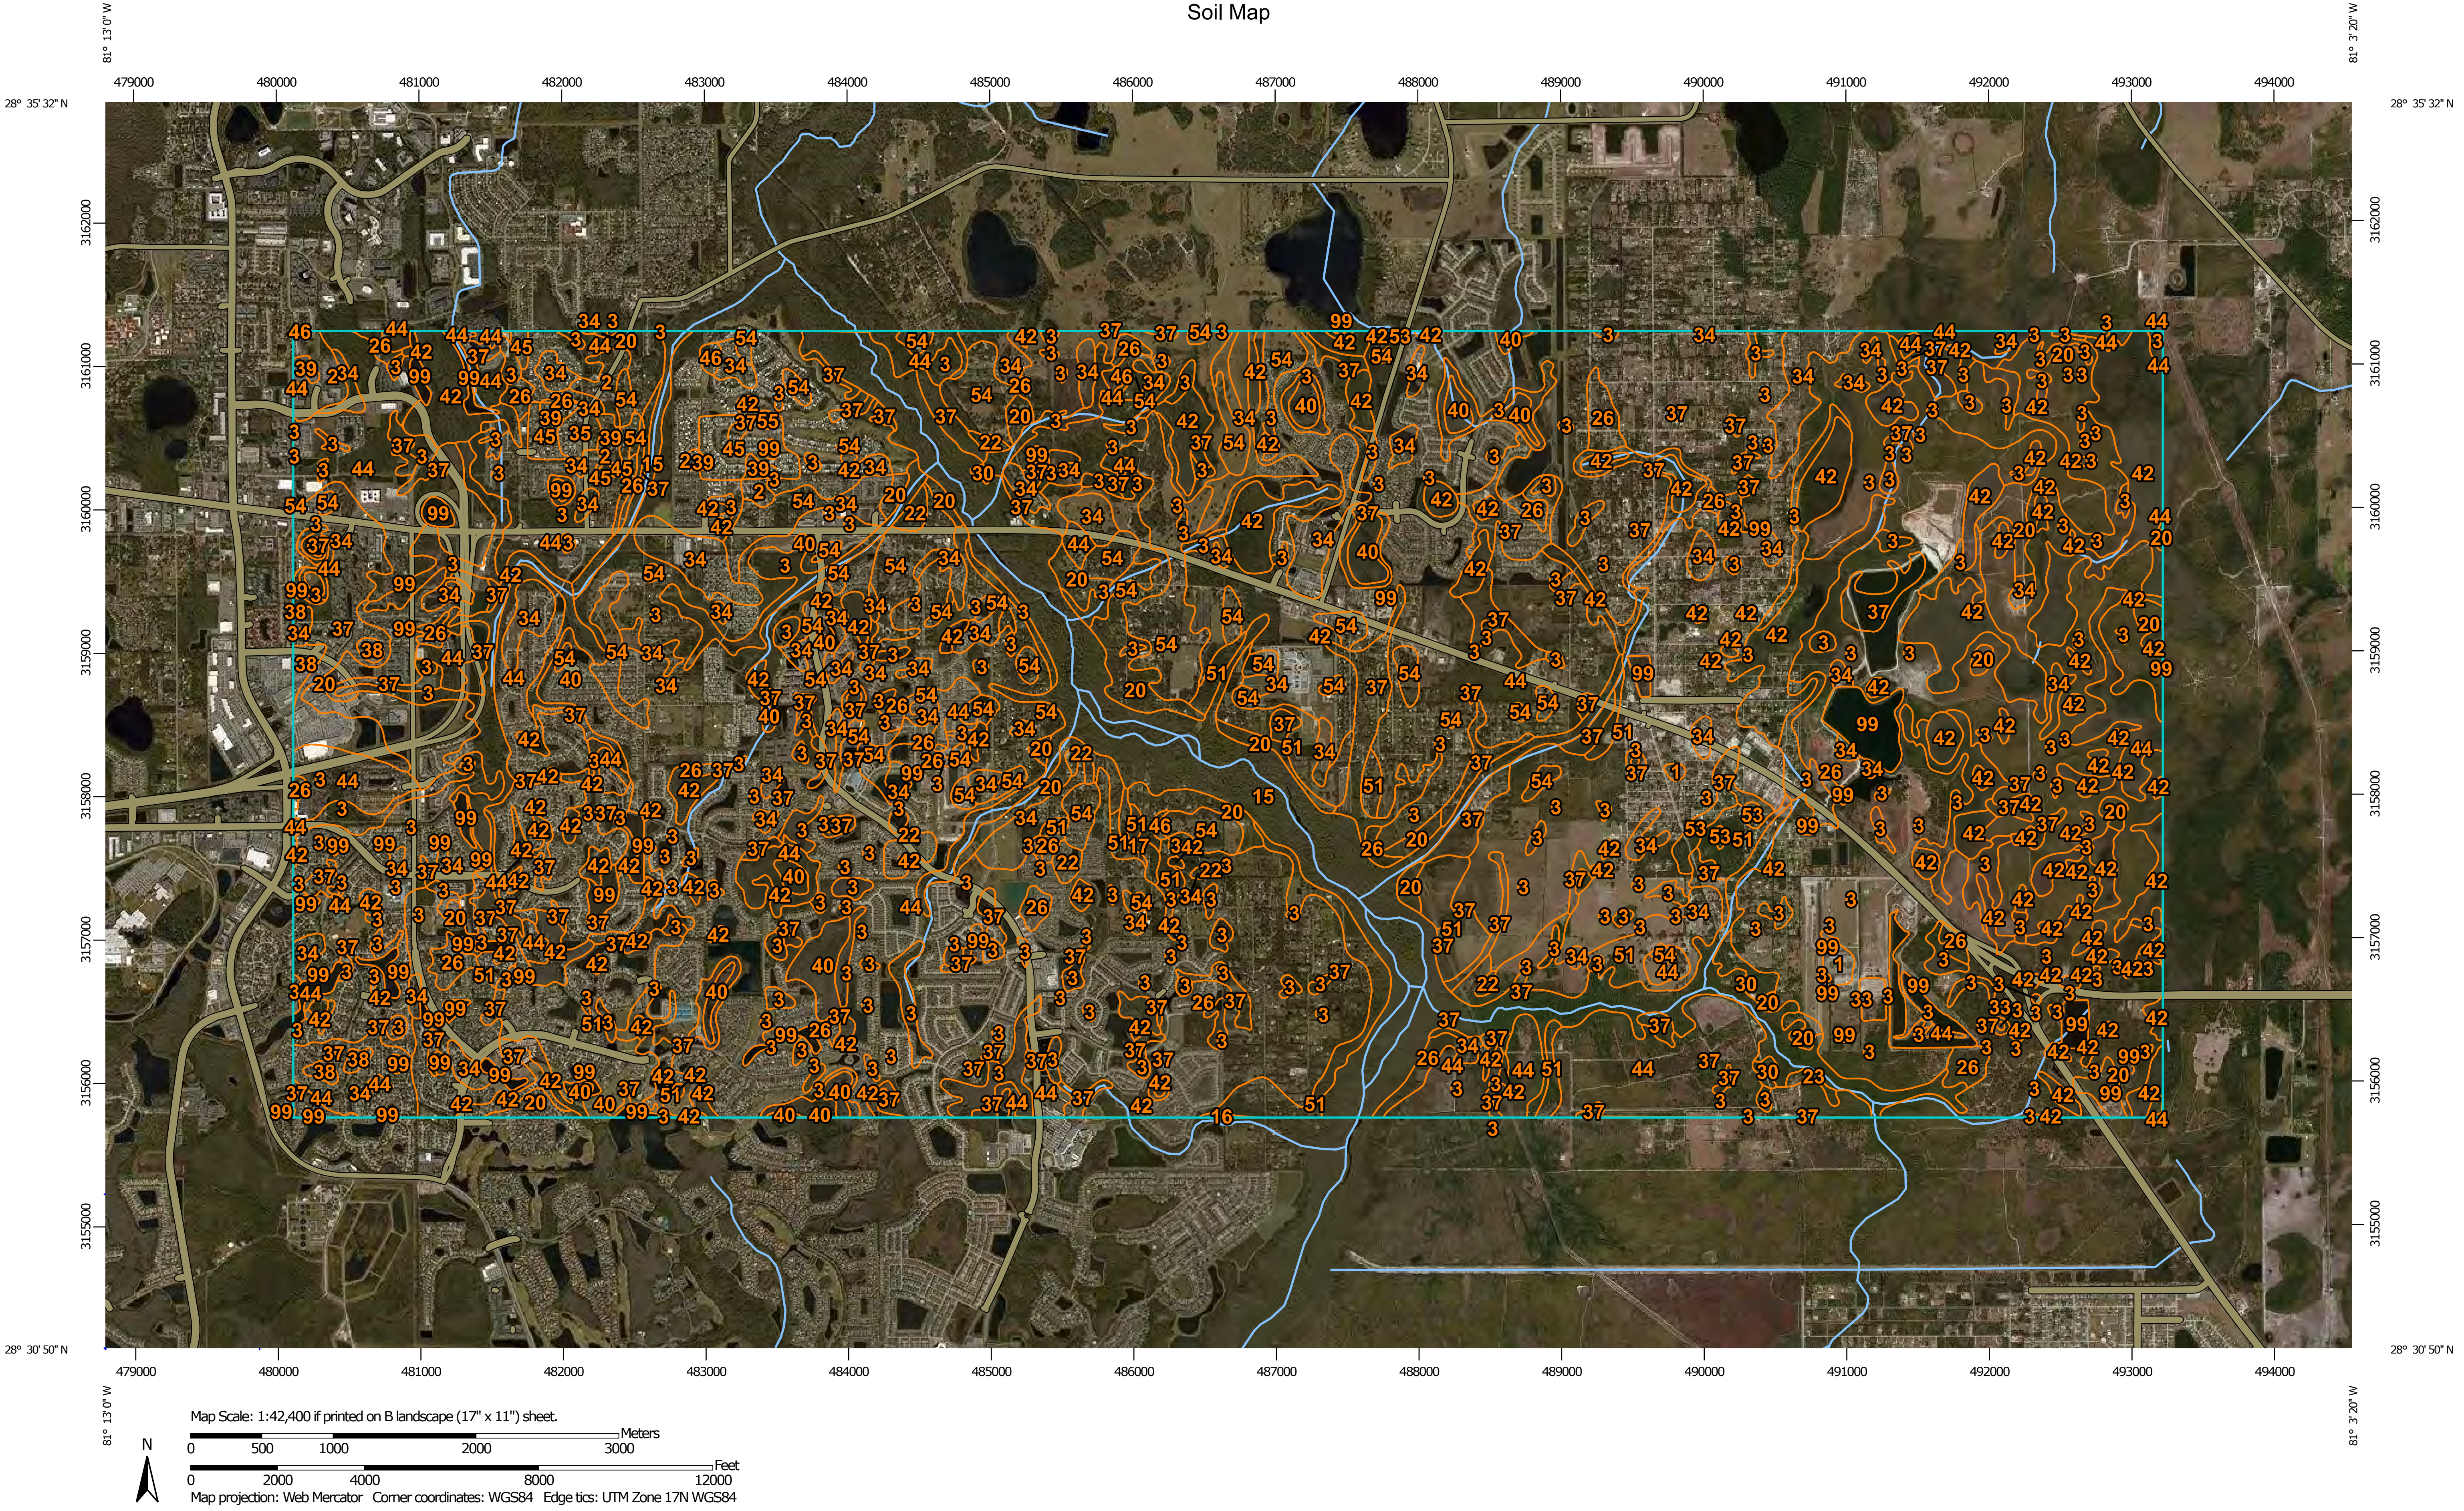
Orange County, Florida

SR 408 Soil Data



May 27, 2016

Custom Soil Resource Report
Soil Map



MAP LEGEND

Area of Interest (AOI)
- Area of Interest (AOI)

Soils
- Soil Map Unit Polygons
- Soil Map Unit Lines
- Soil Map Unit Points

Special Point Features
- Blowout
- Borrow Pit
- Clay Spot
- Closed Depression
- Gravel Pit
- Gravelly Spot
- Landfill
- Lava Flow
- Marsh or swamp
- Mine or Quarry
- Miscellaneous Water
- Perennial Water
- Rock Outcrop
- Saline Spot
- Sandy Spot
- Severely Eroded Spot
- Sinkhole
- Slide or Slip
- Sodic Spot
- Spoil Area
- Stony Spot
- Very Stony Spot
- Wet Spot
- Other
- Special Line Features

Water Features
- Streams and Canals

Transportation
- Rails
- Interstate Highways
- US Routes
- Major Roads
- Local Roads

Background
- Aerial Photography

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Orange County, Florida
Survey Area Data: Version 12, Nov 19, 2015

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 12, 2011—Feb 20, 2015

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Orange County, Florida (FL095)			
Map Unit Symbol	**Map Unit Name**	**Acres in AOI**	**Percent of AOI**
1	Arents, nearly level	16.4	0.1%
2	Archbold fine sand, 0 to 5 percent slopes	73.1	0.4%
3	Basinger fine sand, depressional, 0 to 1 percent slopes	1,106.2	6.2%
15	Felda fine sand, frequently flooded	1,060.0	5.9%
16	Floridana fine sand, frequently flooded	1.5	0.0%
17	Floridana mucky fine sand, depressional	13.6	0.1%
20	Immokalee fine sand	754.8	4.2%
22	Lochloosa fine sand	57.6	0.3%
23	Malabar fine sand	7.3	0.0%
26	Ona fine sand	193.0	1.1%
27	Ona-Urban land complex	4.8	0.0%
30	Pineda fine sand	28.5	0.2%
33	Pits	13.4	0.1%
34	Pomello fine sand, 0 to 5 percent slopes	986.4	5.5%
35	Pomello-Urban land complex, 0 to 5 percent slopes	19.4	0.1%
37	St. Johns fine sand	920.5	5.2%
38	St. Lucie fine sand, 0 to 5 percent slopes	34.7	0.2%
39	St. Lucie-Urban land complex, 0 to 5 percent slopes	29.9	0.2%
40	Samsula muck	145.3	0.8%
42	Sanibel muck	1,496.8	8.4%
44	Smyrna-Smyrna, wet, fine sand, 0 to 2 percent slopes	9,067.4	50.9%
45	Smyrna-Urban land complex	80.9	0.5%
46	Tavares fine sand, 0 to 5 percent slopes	11.6	0.1%
51	Wabasso fine sand, 0 to 2 percent slopes	669.4	3.8%
53	Wauberg fine sand	26.8	0.2%
54	Zolfo fine sand, 0 to 2 percent slopes	717.2	4.0%
55	Zolfo-Urban land complex	11.2	0.1%
99	Water	277.9	1.6%
Totals for Area of Interest		**17,825.4**	**100.0%**

3—Basinger fine sand, depressional, 0 to 1 percent slopes

Map Unit Setting

National map unit symbol: 2v16v
Elevation: 0 to 160 feet
Mean annual precipitation: 38 to 62 inches
Mean annual air temperature: 68 to 77 degrees F
Frost-free period: 300 to 365 days
Farmland classification: Not prime farmland

Map Unit Composition

Basinger, depressional, and similar soils: 90 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Basinger, Depressional

Setting

Landform: Depressions on marine terraces, drainageways on marine terraces
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread, dip
Down-slope shape: Concave
Across-slope shape: Concave
Parent material: Sandy marine deposits

Typical profile

A - 0 to 5 inches: fine sand
E - 5 to 14 inches: fine sand
Bh/E - 14 to 36 inches: fine sand
Cg - 36 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 1 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Very poorly drained
Runoff class: Negligible
Capacity of the most limiting layer to transmit water (Ksat): High to very high (6.00 to 20.00 in/hr)

Depth to water table: About 0 inches
Frequency of flooding: None
Frequency of ponding: Frequent
Calcium carbonate, maximum in profile: 1 percent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Low (about 5.9 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7w
Hydrologic Soil Group: A/D
Other vegetative classification: Freshwater Marshes and Ponds (R155XY010FL), Sandy soils on stream terraces, flood plains, or in depressions (G155XB145FL)
Hydric soil rating: Yes

Minor Components

Smyrna, hydric

Percent of map unit: 5 percent
Landform: — error in exists on —
Landform position (three-dimensional): Tread, talf
Down-slope shape: Convex
Across-slope shape: Linear
Other vegetative classification: South Florida Flatwoods (R155XY003FL), Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: Yes

Samsula, muck

Percent of map unit: 3 percent
Landform: Depressions on marine terraces
Landform position (three-dimensional): Tread, dip, talf
Down-slope shape: Concave
Across-slope shape: Concave
Other vegetative classification: Freshwater Marshes and Ponds (R155XY010FL), Organic soils in depressions and on flood plains (G155XB645FL)
Hydric soil rating: Yes

Floridana, hydric

Percent of map unit: 2 percent
Landform: Depressions on marine terraces
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Dip
Down-slope shape: Concave
Across-slope shape: Concave
Other vegetative classification: Cypress Woodlands (MCV026CA), Sandy over loamy soils on stream terraces, flood plains, or in depressions (G155XB245FL)
Hydric soil rating: Yes

20—Immokalee fine sand

Map Unit Setting

National map unit symbol: bv7n
Mean annual precipitation: 45 to 53 inches
Mean annual air temperature: 70 to 77 degrees F
Frost-free period: 350 to 365 days
Farmland classification: Not prime farmland

Map Unit Composition

Immokalee, non-hydric, and similar soils: 82 percent
Immokalee, hydric, and similar soils: 10 percent
Minor components: 8 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Immokalee, Non-hydric

Setting

Landform: Flatwoods on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Sandy marine deposits

Typical profile

A - 0 to 5 inches: fine sand
E - 5 to 35 inches: fine sand
Bh - 35 to 67 inches: fine sand
C - 67 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Poorly drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: About 6 to 12 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Moderate (about 6.1 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 4w
Hydrologic Soil Group: B/D
Other vegetative classification: Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

Description of Immokalee, Hydric

Setting

Landform: Flats on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Concave
Across-slope shape: Linear
Parent material: Sandy marine deposits

Typical profile

A - 0 to 5 inches: fine sand
E - 5 to 35 inches: fine sand

Bh - 35 to 67 inches: fine sand
C - 67 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Poorly drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: About 0 to 12 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Moderate (about 6.1 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 4w
Hydrologic Soil Group: B/D
Other vegetative classification: Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: Yes

Minor Components

Pineda

Percent of map unit: 4 percent
Landform: Flats on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Linear
Across-slope shape: Linear
Other vegetative classification: Sandy over loamy soils on flats of hydric or mesic lowlands (G155XB241FL)
Hydric soil rating: Yes

Wabasso

Percent of map unit: 4 percent
Landform: Flatwoods on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Convex
Across-slope shape: Linear
Other vegetative classification: Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

34—Pomello fine sand, 0 to 5 percent slopes

Map Unit Setting

National map unit symbol: 2v16y
Elevation: 0 to 180 feet
Mean annual precipitation: 44 to 52 inches
Mean annual air temperature: 70 to 77 degrees F
Frost-free period: 342 to 365 days
Farmland classification: Not prime farmland

Map Unit Composition

Pomello and similar soils: 95 percent
Minor components: 5 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Pomello

Setting

Landform: Knolls on marine terraces, ridges on marine terraces
Landform position (two-dimensional): Shoulder
Landform position (three-dimensional): Interfluve, riser
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Sandy marine deposits

Typical profile

A - 0 to 4 inches: fine sand
E - 4 to 47 inches: fine sand
Bh - 47 to 58 inches: fine sand
Bw - 58 to 65 inches: fine sand
C - 65 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 5 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Moderately well drained
Runoff class: Negligible
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.60 to 6.00 in/hr)
Depth to water table: About 24 to 42 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Low (about 5.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6s
Hydrologic Soil Group: A
Other vegetative classification: Sand Pine Scrub (R155XY001FL), Sandy soils on rises and knolls of mesic uplands (G155XB131FL)
Hydric soil rating: No

Minor Components

Smyrna

Percent of map unit: 3 percent
Landform: Flats on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Convex
Across-slope shape: Linear
Other vegetative classification: Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

Tavares

Percent of map unit: 1 percent
Landform: Ridges on marine terraces, flats on marine terraces
Landform position (three-dimensional): Interfluve
Down-slope shape: Convex
Across-slope shape: Linear
Ecological site: Longleaf Pine-Turkey Oak Hills (R154XY002FL)
Other vegetative classification: Sandy soils on rises, knolls, and ridges of mesic uplands (G154XB121FL)
Hydric soil rating: No

Bulow

Percent of map unit: 1 percent
Landform: Ridges on marine terraces
Landform position (three-dimensional): Interfluve
Down-slope shape: Convex
Across-slope shape: Linear
Other vegetative classification: Sandy over loamy soils on knolls and ridges of mesic uplands (G155XB211FL)
Hydric soil rating: No

37—St. Johns fine sand

Map Unit Setting

National map unit symbol: bv87
Elevation: 30 to 150 feet
Mean annual precipitation: 45 to 53 inches
Mean annual air temperature: 70 to 77 degrees F
Frost-free period: 350 to 365 days
Farmland classification: Not prime farmland

Map Unit Composition

St. johns, non-hydric, and similar soils: 60 percent
St. johns, hydric, and similar soils: 30 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of St. Johns, Non-hydric

Setting

Landform: Flats on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Sandy marine deposits

Typical profile

A - 0 to 12 inches: fine sand
E - 12 to 24 inches: fine sand
Bh - 24 to 44 inches: fine sand
C - 44 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Poorly drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.20 to 1.98 in/hr)
Depth to water table: About 6 to 12 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Moderate (about 7.2 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3w

Hydrologic Soil Group: B/D
Other vegetative classification: Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

Description of St. Johns, Hydric

Setting

Landform: Flats on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Sandy marine deposits

Typical profile

A - 0 to 12 inches: fine sand
E - 12 to 24 inches: fine sand
Bh - 24 to 44 inches: fine sand
C - 44 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Poorly drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.20 to 1.98 in/hr)
Depth to water table: About 0 to 12 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Moderate (about 7.2 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3w
Hydrologic Soil Group: B/D
Other vegetative classification: Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: Yes

Minor Components

Wabasso

Percent of map unit: 5 percent
Landform: Flatwoods on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Convex
Across-slope shape: Linear
Other vegetative classification: Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

Immokalee, non-hydric

Percent of map unit: 5 percent
Landform: Flatwoods on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Convex
Across-slope shape: Linear
Other vegetative classification: Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

42—Sanibel muck

Map Unit Setting

National map unit symbol: bv8f
Mean annual precipitation: 45 to 53 inches
Mean annual air temperature: 70 to 77 degrees F
Frost-free period: 350 to 365 days
Farmland classification: Not prime farmland

Map Unit Composition

Sanibel, undrained, and similar soils: 65 percent
Sanibel, drained, and similar soils: 25 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Sanibel, Undrained

Setting

Landform: Marshes on marine terraces
Landform position (three-dimensional): Dip
Down-slope shape: Concave
Across-slope shape: Concave
Parent material: Thin organic material over sandy marine deposits

Typical profile

Oa - 0 to 11 inches: muck
A - 11 to 15 inches: fine sand
C - 15 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 1 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Very poorly drained
Runoff class: Negligible
Capacity of the most limiting layer to transmit water (Ksat): High to very high (5.95 to 19.98 in/hr)
Depth to water table: About 0 inches
Frequency of flooding: None
Frequency of ponding: Frequent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Moderate (about 7.5 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7w
Hydrologic Soil Group: A/D
Other vegetative classification: Organic soils in depressions and on flood plains (G155XB645FL)
Hydric soil rating: Yes

Description of Sanibel, Drained

Setting

Landform: Depressions on marine terraces
Landform position (three-dimensional): Dip
Down-slope shape: Concave
Across-slope shape: Concave
Parent material: Thin organic material over sandy marine deposits

Typical profile

Oa - 0 to 11 inches: muck
A - 11 to 15 inches: fine sand
C - 15 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 1 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Very poorly drained
Runoff class: Negligible
Capacity of the most limiting layer to transmit water (Ksat): High to very high (5.95 to 19.98 in/hr)
Depth to water table: About 0 to 24 inches
Frequency of flooding: None
Frequency of ponding: Frequent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Moderate (about 7.5 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3w
Hydrologic Soil Group: A/D
Other vegetative classification: Organic soils in depressions and on flood plains (G155XB645FL)
Hydric soil rating: Yes

Minor Components

Hontoon, undrained

Percent of map unit: 5 percent
Landform: Depressions on marine terraces
Landform position (three-dimensional): Dip
Down-slope shape: Concave
Across-slope shape: Concave
Other vegetative classification: Organic soils in depressions and on flood plains (G155XB645FL)
Hydric soil rating: Yes

Samsula

Percent of map unit: 5 percent
Landform: Depressions on marine terraces
Landform position (three-dimensional): Dip
Down-slope shape: Concave
Across-slope shape: Concave
Other vegetative classification: Organic soils in depressions and on flood plains (G155XB645FL)
Hydric soil rating: Yes

44—Smyrna-Smyrna, wet, fine sand, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: 2v171
Elevation: 0 to 150 feet
Mean annual precipitation: 38 to 62 inches
Mean annual air temperature: 68 to 77 degrees F
Frost-free period: 300 to 365 days
Farmland classification: Not prime farmland

Map Unit Composition

Smyrna, non-hydric, and similar soils: 76 percent
Smyrna, hydric, and similar soils: 20 percent
Minor components: 4 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Smyrna, Non-hydric

Setting

Landform: Flatwoods on marine terraces, flats on marine terraces
Landform position (two-dimensional): Footslope
Landform position (three-dimensional): Talf
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Sandy marine deposits

Typical profile

A - 0 to 4 inches: fine sand
E - 4 to 17 inches: fine sand
Bh - 17 to 27 inches: loamy fine sand
C - 27 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Poorly drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.60 to 6.00 in/hr)
Depth to water table: About 6 to 18 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Low (about 3.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 4w
Hydrologic Soil Group: A/D
Other vegetative classification: South Florida Flatwoods (R155XY003FL), Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

Description of Smyrna, Hydric

Setting

Landform: Flats on marine terraces, flatwoods on marine terraces
Landform position (two-dimensional): Footslope
Landform position (three-dimensional): Talf
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Sandy marine deposits

Typical profile

A - 0 to 4 inches: fine sand
E - 4 to 17 inches: fine sand
Bh - 17 to 27 inches: loamy fine sand
C - 27 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 2 percent

Depth to restrictive feature: More than 80 inches
Natural drainage class: Poorly drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.60 to 6.00 in/hr)
Depth to water table: About 0 to 6 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Low (about 3.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 4w
Hydrologic Soil Group: A/D
Other vegetative classification: South Florida Flatwoods (R155XY003FL), Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: Yes

Minor Components

Basinger, depressional

Percent of map unit: 2 percent
Landform: Depressions on marine terraces
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Dip
Down-slope shape: Concave
Across-slope shape: Concave
Other vegetative classification: Sandy soils on stream terraces, flood plains, or in depressions (G155XB145FL)
Hydric soil rating: Yes

Pomona, non-hydric

Percent of map unit: 1 percent
Landform: Flatwoods on marine terraces
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Talf
Down-slope shape: Convex
Across-slope shape: Linear
Other vegetative classification: Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

Eaugallie, hydric

Percent of map unit: 1 percent
Landform: Flatwoods on marine terraces, flats on marine terraces
Landform position (two-dimensional): Footslope
Landform position (three-dimensional): Dip
Down-slope shape: Linear
Across-slope shape: Linear
Other vegetative classification: South Florida Flatwoods (R154XY003FL), Sandy soils on flats of mesic or hydric lowlands (G154XB141FL)
Hydric soil rating: Yes

Across-slope shape: Linear
Other vegetative classification: North Florida Flatwoods (R154XY004FL), Sandy soils on rises and knolls of mesic uplands (G155XB131FL)
Hydric soil rating: No

51—Wabasso fine sand, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: 2svzg
Elevation: 0 to 130 feet
Mean annual precipitation: 38 to 62 inches
Mean annual air temperature: 68 to 77 degrees F
Frost-free period: 300 to 365 days
Farmland classification: Not prime farmland

Map Unit Composition

Wabasso and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Wabasso

Setting

Landform: Flatwoods on flats on marine terraces
Landform position (three-dimensional): Tread, talf
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Sandy marine deposits over loamy marine deposits

Typical profile

A - 0 to 4 inches: fine sand
E - 4 to 16 inches: fine sand
Bh - 16 to 28 inches: fine sand
E' - 28 to 32 inches: fine sand
Btg - 32 to 48 inches: fine sandy loam
Cg - 48 to 80 inches: loamy fine sand

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: 12 to 63 inches to strongly contrasting textural stratification
Natural drainage class: Poorly drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): High (2.00 to 6.00 in/hr)
Depth to water table: About 6 to 18 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum in profile: 5 percent

Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Low (about 3.6 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3w
Hydrologic Soil Group: A/D
Other vegetative classification: South Florida Flatwoods (R155XY003FL), Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

Minor Components

Basinger

Percent of map unit: 4 percent
Landform: Drainageways on flatwoods on marine terraces
Landform position (three-dimensional): Tread, talf, dip
Down-slope shape: Convex, linear, concave
Across-slope shape: Linear, convex, concave
Other vegetative classification: Slough (R155XY011FL), Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: Yes

Felda

Percent of map unit: 4 percent
Landform: Flatwoods on drainageways on marine terraces
Landform position (three-dimensional): Tread, dip, talf
Down-slope shape: Linear
Across-slope shape: Concave, linear
Ecological site: Slough (R155XY011FL)
Other vegetative classification: Slough (R155XY011FL), Sandy over loamy soils on stream terraces, flood plains, or in depressions (G155XB245FL)
Hydric soil rating: Yes

Riviera

Percent of map unit: 4 percent
Landform: Flatwoods on drainageways on marine terraces
Landform position (three-dimensional): Tread, talf, dip
Down-slope shape: Linear, convex
Across-slope shape: Concave, linear
Ecological site: Slough (R155XY011FL)
Other vegetative classification: Slough (R155XY011FL), Sandy over loamy soils on flats of hydric or mesic lowlands (G156AC241FL)
Hydric soil rating: Yes

Boca

Percent of map unit: 3 percent
Landform: Flatwoods on marine terraces
Landform position (three-dimensional): Tread, talf
Down-slope shape: Convex
Across-slope shape: Linear
Ecological site: South Florida Flatwoods (R155XY003FL)
Other vegetative classification: South Florida Flatwoods (R155XY003FL), Sandy over loamy soils on flats of hydric or mesic lowlands (G155XB241FL)
Hydric soil rating: Yes

53—Wauberg fine sand

Map Unit Setting

National map unit symbol: bv8t
Mean annual precipitation: 45 to 53 inches
Mean annual air temperature: 70 to 77 degrees F
Frost-free period: 350 to 365 days
Farmland classification: Not prime farmland

Map Unit Composition

Wauberg and similar soils: 94 percent
Minor components: 6 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Wauberg

Setting

Landform: Flats on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Sandy and loamy marine deposits

Typical profile

A - 0 to 8 inches: fine sand
E - 8 to 28 inches: fine sand
B - 28 to 60 inches: sandy clay loam
C - 60 to 80 inches: sandy clay

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Poorly drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: About 0 to 6 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Low (about 5.4 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3w
Hydrologic Soil Group: D
Other vegetative classification: Sandy over loamy soils on flats of hydric or mesic lowlands (G155XB241FL)

Hydric soil rating: Yes

Minor Components

Wabasso

Percent of map unit: 6 percent
Landform: Flatwoods on marine terraces
Landform position (three-dimensional): Talf
Down-slope shape: Convex
Across-slope shape: Linear
Other vegetative classification: Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

54—Zolfo fine sand, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: 2w0q1
Elevation: 30 to 160 feet
Mean annual precipitation: 44 to 56 inches
Mean annual air temperature: 68 to 75 degrees F
Frost-free period: 324 to 365 days
Farmland classification: Farmland of unique importance

Map Unit Composition

Zolfo and similar soils: 88 percent
Minor components: 12 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Zolfo

Setting

Landform: Rises on marine terraces, knolls on marine terraces
Landform position (two-dimensional): Summit, footslope
Landform position (three-dimensional): Interfluve, side slope, riser
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Sandy marine deposits

Typical profile

A - 0 to 6 inches: fine sand
E - 6 to 53 inches: fine sand
Bh - 53 to 80 inches: fine sand

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Somewhat poorly drained
Runoff class: Negligible
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)

Depth to water table: About 24 to 42 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Low (about 5.3 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3w
Hydrologic Soil Group: A
Other vegetative classification: North Florida Flatwoods (R154XY004FL), South Florida Flatwoods (R154XY003FL), Sandy soils on rises and knolls of mesic uplands (G154XB131FL)
Hydric soil rating: No

Minor Components

Myakka

Percent of map unit: 4 percent
Landform: Flatwoods on marine terraces
Landform position (three-dimensional): Tread, talf
Down-slope shape: Convex
Across-slope shape: Linear
Other vegetative classification: South Florida Flatwoods (R155XY003FL), Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: No

Tavares

Percent of map unit: 3 percent
Landform: Ridges on marine terraces
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Interfluve, tread, rise
Down-slope shape: Linear, convex
Across-slope shape: Linear
Other vegetative classification: Longleaf Pine-Turkey Oak Hills (R154XY002FL), Sandy soils on rises, knolls, and ridges of mesic uplands (G154XB121FL)
Hydric soil rating: No

Millhopper

Percent of map unit: 3 percent
Landform: Ridges on marine terraces, knolls on marine terraces, flatwoods on marine terraces
Landform position (two-dimensional): Shoulder, summit
Landform position (three-dimensional): Interfluve
Down-slope shape: Convex, concave
Across-slope shape: Linear
Other vegetative classification: Upland Hardwood Hammock (R154XY008FL), Sandy soils on rises, knolls, and ridges of mesic uplands (G154XB121FL)
Hydric soil rating: No

Lochloosa

Percent of map unit: 1 percent
Landform: Rises on marine terraces
Landform position (three-dimensional): Interfluve, rise
Down-slope shape: Convex

Across-slope shape: Linear
Other vegetative classification: Sandy over loamy soils on rises and knolls of mesic uplands (G155XB231FL)
Hydric soil rating: No

Malabar

Percent of map unit: 1 percent
Landform: Drainageways on marine terraces
Landform position (three-dimensional): Dip
Down-slope shape: Linear, convex
Across-slope shape: Concave, linear
Other vegetative classification: Slough (R155XY011FL), Sandy soils on flats of mesic or hydric lowlands (G155XB141FL)
Hydric soil rating: Yes

Cross Drain Hydraulic Analysis

Cross Drain 1

CD-1 Preliminary Culvert Sizing

The flow rate for a 100-year storm event from the Big Econ Stormwater Management Master Plan was used to size this culvert. The Manning's Equation was used to produce a trial size for the cross drain. The trial size was used to perform HY-8 analysis. While performing the overtopping analysis, the cross drain was appropriately sized in order to not violate floodplain criteria. The following presents a detailed calculation for sizing CD-1.

Flow Rate 10 =	873	ft^3/s
Flow Rate 25 =	1013	ft^3/s
Flow Rate 50 =	1160	ft^3/s
Flow Rate 100 =	1322	ft^3/s
Flow Rate 500 =	1760	ft^3/s
Pipe Length =	485	ft
Change in FL Elevation from Upstream to Downstream =	0.50	ft
Manning's "n" value =	0.012	

$D = (2.159\ Qn/S^{0.5})^{3/8}$

D =	13.66	ft
D =	163.95	in
A =	146.60	ft^2
Proposed Size =	3-11'x5'	CBC

Cross Drain 3A

CD-3A Preliminary Culvert Sizing

The calculated flow rate for a 100-year storm event, determined by the Rational Method, was used to size this culvert. The Manning's Equation was used to produce a trial size for the cross drain. The trial size was used to perform HY-8 analysis. While performing the overtopping analysis, the cross drain was appropriately sized in order to not violate floodplain criteria. The following presents a detailed calculation for sizing CD-3A.

Flow Rate 10 =	3.59	ft^3/s
Flow Rate 25 =	4.38	ft^3/s
Flow Rate 50 =	5.76	ft^3/s
Flow Rate 100 =	7.69	ft^3/s
Flow Rate 500 =	12.65	ft^3/s
Pipe Length =	303	ft
Change in FL Elevation from Upstream to Downstream =	0.50	ft
Manning's "n" value =	0.012	

$$D = (2.159\ Qn/S^{0.5})^{3/8}$$

D =	1.82	ft
D =	21.78	in
A =	2.59	ft^2
Proposed Size =	1-30"	RCP

Cross Drain 6

CD-6 Preliminary Culvert Sizing

The calculated flow rate for a 100-year storm event, determined by the Rational Method, was used to size this culvert. The Manning's Equation was used to produce a trial size for the cross drain. The trial size was used to perform HY-8 analysis. While performing the overtopping analysis, the cross drain was appropriately sized in order to not violate floodplain criteria. The following presents a detailed calculation for sizing CD-6.

Flow Rate 10 =	112	ft^3/s
Flow Rate 25 =	141	ft^3/s
Flow Rate 50 =	190	ft^3/s
Flow Rate 100 =	259	ft^3/s
Flow Rate 500 =	449	ft^3/s
Pipe Length =	427	ft
Change in FL Elevation from Upstream to Downstream =	0.50	ft
Manning's "n" value =	0.012	

$D = (2.159\ Qn/S^{0.5})^{3/8}$

D =	7.24	ft
D =	86.92	in
A =	41.21	ft^2
Proposed Size =	2-72"	RCP

Cross Drain 8

CD-8 Preliminary Culvert Sizing

The calculated flow rate for a 100-year storm event, determined by the Rational Method, was used to size this culvert. The Manning's Equation was used to produce a trial size for the cross drain. The trial size was used to perform HY-8 analysis. While performing the overtopping analysis, the cross drain was appropriately sized in order to not violate floodplain criteria. The following presents a detailed calculation for sizing CD-8.

Flow Rate 10 =	133	ft^3/s
Flow Rate 25 =	169	ft^3/s
Flow Rate 50 =	223	ft^3/s
Flow Rate 100 =	309	ft^3/s
Flow Rate 500 =	535	ft^3/s
Pipe Length =	447	ft
Change in FL Elevation from Upstream to Downstream =	0.50	ft
Manning's "n" value =	0.012	

$D = (2.159\ Qn/S^{0.5})^{3/8}$

D =	7.80	ft
D =	93.615	in
A =	47.80	ft^2
Proposed Size =	1-10'x5'	CBC

Cross Drain 10

CD-10 Preliminary Culvert Sizing

The flow rate for a 100-year storm event from the Bithlo Area Stormwater Management Master Plan was used to size this culvert. The Manning's Equation was used to produce a trial size for the cross drain. The trial size was used to perform HY-8 analysis. While performing the overtopping analysis, the cross drain was appropriately sized in order to not violate floodplain criteria. The following presents a detailed calculation for sizing CD-10.

Flow Rate 10 =	265	ft^3/s
Flow Rate 25 =	312	ft^3/s
Flow Rate 50 =	353	ft^3/s
Flow Rate 100 =	398	ft^3/s
Flow Rate 500 =	530	ft^3/s
Pipe Length =	310	ft
Change in FL Elevation from Upstream to Downstream =	0.50	ft
Manning's "n" value =	0.012	

$D = (2.159\ Qn/S^{0.5})^{3/8}$

D =	8.01	ft
D =	96.11	in
A =	50.38	ft^2
Proposed Size =	2-6'x4'	CBC

Cross Drain 13

CD-13 Preliminary Culvert Sizing

The flow rate for a 100-year storm event from the Bithlo Area Stormwater Management Master Plan was used to size this culvert. The Manning's Equation was used to produce a trial size for the cross drain. The trial size was used to perform HY-8 analysis. While performing the overtopping analysis, the cross drain was appropriately sized in order to not violate floodplain criteria. The following presents a detailed calculation for sizing CD-13.

Flow Rate 10 =	26	ft^3/s
Flow Rate 25 =	35	ft^3/s
Flow Rate 50 =	42	ft^3/s
Flow Rate 100 =	51	ft^3/s
Flow Rate 500 =	82	ft^3/s
Pipe Length =	325	ft
Change in FL Elevation from Upstream to Downstream =	0.50	ft
Manning's "n" value =	0.012	

$D = (2.159\ Qn/S^{0.5})^{3/8}$

D =	3.74	ft
D =	44.872	in
A =	10.98	ft^2
Proposed Size =	1-48"	RCP

Design Aids

FDOT Drainage Manual

4.3 DESIGN FREQUENCY

4.3.1 Permanent Facilities

Standard design frequencies for permanent culverts, bridge-culverts, and bridges are as follows:

Table 4.1: Design Storm Frequencies of Permanent Facilities

FACILITY	FREQUENCY
Mainline Interstate	50 years
High Use or Essential: Projected 20-year AADT* > 1,500	50 years
Other: Projected 20-year AADT* < 1,500	25 years
• Roadside ditch culverts • Pedestrian and trail bridges	10 years

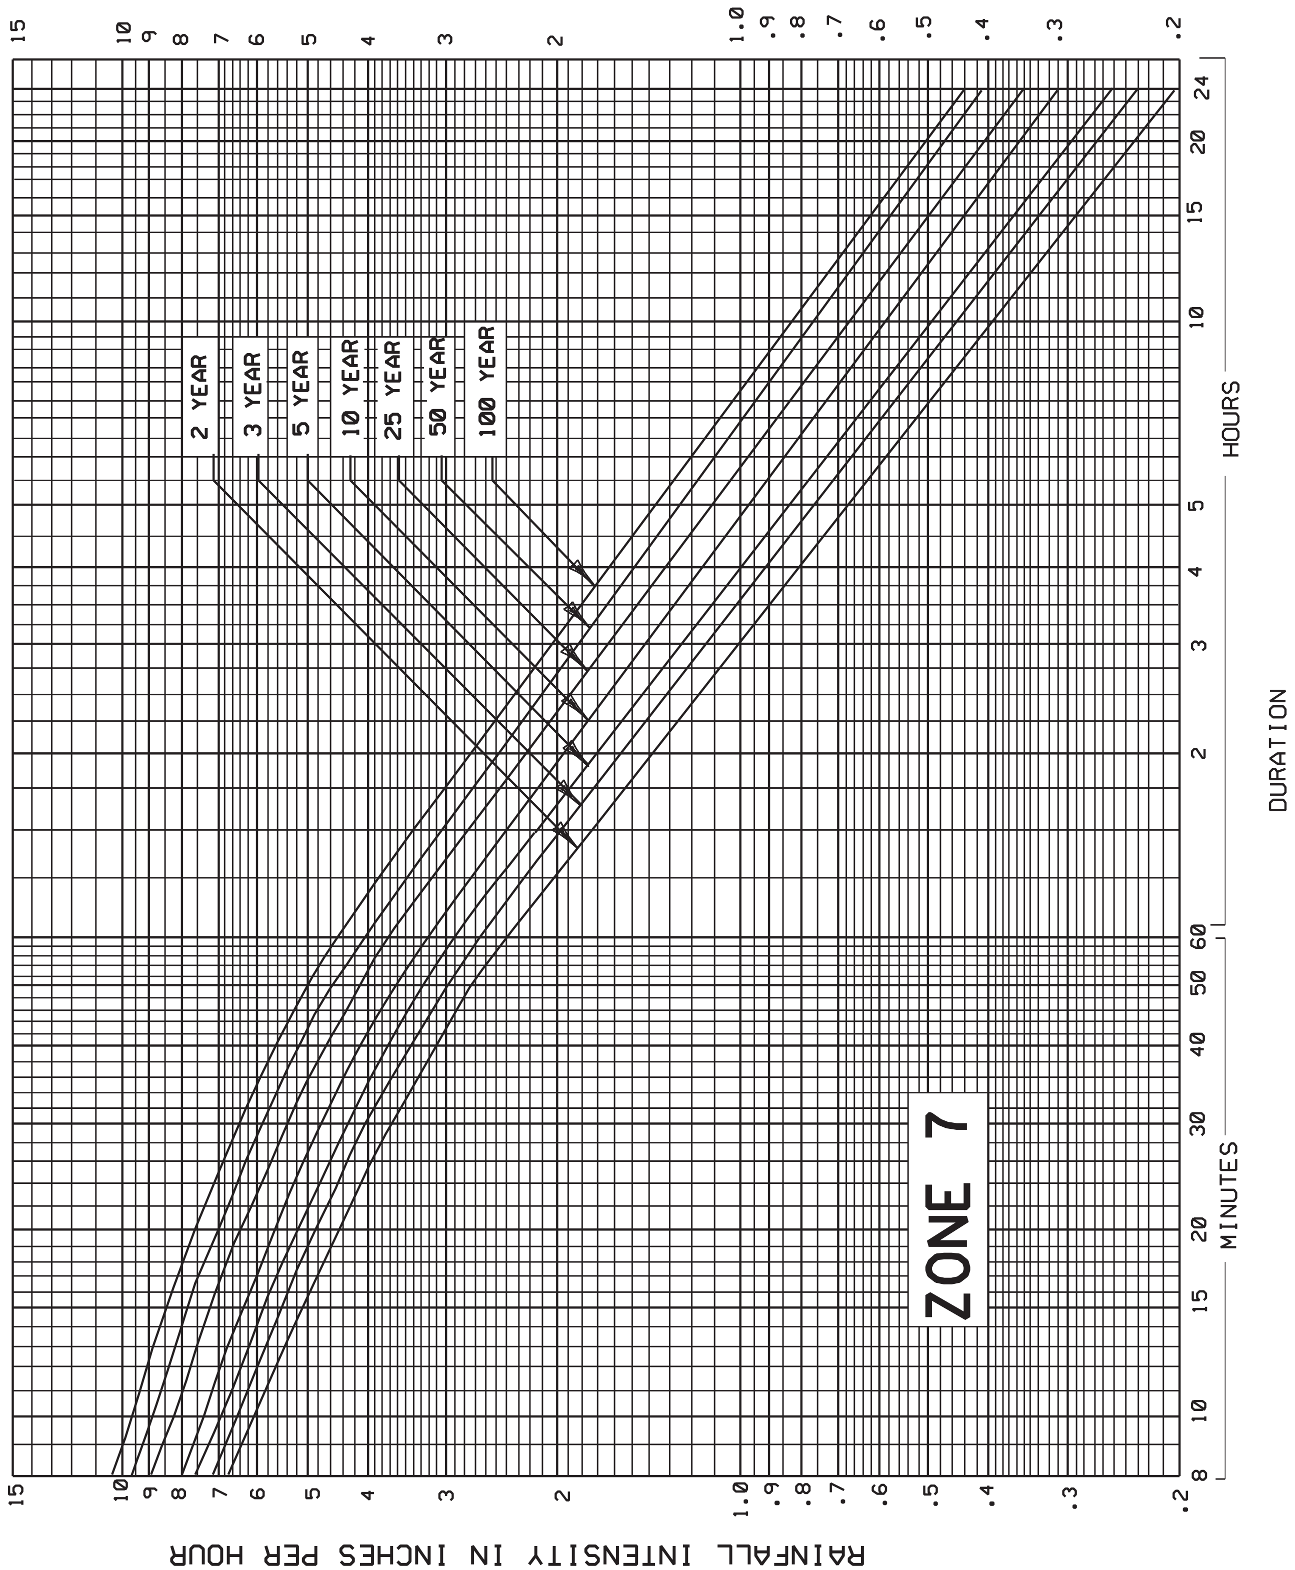
* AADT preferred but if not available ADT may be used.

Note: The flood frequencies used for scour analysis differ. See ***Section 4.9.2***.

4.3.2 Temporary Facilities

Design temporary traversing works accounting for the permitted duration of the work. Temporary traversing work will cause no more than a one-foot increase in the Design Storm Frequency (DSF) flood elevation immediately upstream and no more than one tenth of a foot increase in the DSF flood elevation 500 feet upstream.

Minimum standard design frequencies for temporary culverts, bridge-culverts, and bridges are as follows:



RAINFALL INTENSITY-DURATION-FREQUENCY CURVES
ZONE 7

FDOT Drainage Design Guide

4.7.2 Small Cross Drains

This information applies to cross drains having an area of opening up through a 48-inch-diameter round culvert or the equivalent.

- **Conduct hydrologic analysis**
  Estimate discharges for design year frequency, base flood, and greatest flood. Use one of the following procedures as appropriate (see Section 4.7 of the *Drainage Manual*):

  - Rational Equation (up to 600 acres)
  - Regional or Local Regression Equation

- **Select trial culvert size** based on the following:

$$A = Q/V$$

Where:
A = Culvert area (square feet)
Q = Design discharge (e.g., 50 year)
V = Average velocity (feet per second); use an average velocity of four feet per second

- **Estimate tailwater.** If the outlet is in a free-flowing condition, the crown of the pipe at the outlet may be assumed.

- **Conduct hydraulic analysis** using techniques provided in FHWA HDS 5. Compute headwater conditions for the selected size for the design flood, base flood, and greatest flood or overtopping flood as appropriate.

- **Check hydraulic results** against design standards for backwater, minimum size, and scour. If these standards are satisfied, the trial culvert size is acceptable.

- **Determine the most economical culvert size** that satisfies all standards. If the trial selected size does not satisfy all design standards, obtain a variance.

- **Document** as required in the *Drainage Manual.*

Example 4.7-3 illustrates this procedure.

Example 4.7-3—Design of Small Cross Drain

Referring back to Example 4.7-2, you determined that the two-foot x two-foot concrete box culvert should be replaced. A design frequency of 50 years was determined as the minimum for this roadway. The existing length of the two-foot x two-foot concrete box culvert was 50 feet. However, since the structure will have to be extended four feet on each side, the design length of the proposed structure will be 58 feet.

Proposed Elevations are as follows:
Allowable headwater (edge of travel lane) = 104.6 ft
Flow line (upstream) = 100.1 ft
Flow line (downstream) = 99.7 ft

- **Conduct hydrologic analysis**
  Estimate discharges for design-year frequency, base flood, and greatest flood. Use one of following procedures as appropriate (see Section 4.7 of the *Drainage Manual*):

  - Rational Equation (up to 600 acres)
  - Regional or Local Regression Equation

  Use the same discharges from Example 4.7-2:

  $Q(50) = 35\ ft^3/sec$
  $Q(100) = 52\ ft^3/sec$
  $Q(500) = 88\ ft^3/sec$

- **Select trial culvert size**

$$A = \frac{Q}{V} = \frac{35\ ft^3/s}{4\ ft/s} = 8.8\,ft^2$$

  D = 3.3 ft., so try D = 36-inch pipe and 42-inch pipe

- **Conduct hydraulic analysis** using FHWA HDS 5 procedures.

  The hydraulic analysis would be similar to what was done in Example 4.7-1 and Example 4.7-2. A worksheet of the calculations for the 50-year frequency is shown in Figure 4.7-3. The other frequencies also would need to be analyzed for an actual project. The analysis shown in Figure 4.7-3 is for the proposed conditions.

- **Check hydraulic results** against design standards.

  Review of the worksheet in Figure 4.7-3 indicates that the roadway will not overtop for the 50-year frequency for either culvert size. There is very little difference between the 36-inch and 42 inch pipe as far as controlling headwater. Therefore, either pipe size would be adequate. However, it is recommended that the 36-inch pipe be installed since it would be slightly less in cost than the 42-inch pipe. In addition, it would be recommended that a rubble ditch lining design be installed at the outlet end due to velocities exceeding six feet per second.

- If design does not meet standards or if you can use more economical culvert size that satisfies the standards, then perform new computations for that design.

Document as required in the *Drainage Manual*.

4.7.3 Large Cross Drains

This information applies to cross drains having an area of opening greater than a 48-inch diameter pipe and less than a 20-foot bridge. The procedure for large cross drains is similar to that for small cross drains except that a greater level of effort and detail is expected in developing the hydrologic estimates and the determination of tailwater conditions.

- **Conduct hydrologic analysis**
  Estimate discharges for design-year frequency, base flood, and greatest flood. Use one of following procedures as appropriate (see Section 4.7 of the *Drainage Manual*):

  - Frequency analysis of observed conditions
  - Regional or Local Regression Equation
  - Rational Equation (up to 600 acres)

The remaining steps are the same as those identified in Section 4.7.2 for small cross drains.

Table B-1: Overland Flow Manning's n Values

	Value	Recommended Range of Values
Concrete	0.011	0.010 - 0.013
Asphalt	0.012	0.010 - 0.015

Chisel plow (1/4 - 1 tons/acre residue)	0.18	0.070 - 0.34
Chisel plow (1 - 3 tons/acre residue)	0.30	0.190 - 0.47
Chisel plow (>3 tons/acre residue)	0.40	0.340 - 0.46
Disk/Harrow (<1/4 tons/acre residue)	0.08	0.008 - 0.41
Disk/Harrow (1/4 - 1 tons/acre residue)	0.16	0.100 - 0.25
Disk/Harrow (1 - 3 tons/acre residue)	0.25	0.140 - 0.53
Disk/Harrow (>3 tons/acre residue)	0.30	-- --
No till (</4 tons/acre residue)	0.04	0.030 - 0.07
No till (1/4 - 1 tons/acre residue)	0.07	0.010 - 0.13
No till (1 - 3 tons/acre residue)	0.30	0.160 - 0.47
Plow (Fall)	0.06	0.020 - 0.10
Coulter	0.10	0.050 - 0.13
Range (natural)	0.13	0.010 - 0.32
Range (clipped)	0.08	0.020 - 0.24
Grass (bluegrass sod)	0.45	0.390 - 0.63
Short grass prairie [a]	0.15	0.100 - 0.20
Dense grass [c]	0.24	0.170 - 0.30
Bermuda grass [c]	0.41	0.300 - 0.48
Woods	0.45	-- --

All values are from Engman (1983), unless noted otherwise.

[a]Woolhiser (1975).

[b]Fallow has been idle for one year and is fairly smooth.

[c]Palmer (1946). Weeping love grass, bluegrass, buffalo grass, blue gamma grass, native grass mix (OK), alfalfa, lespedeza.

Note: These values were determined specifically for overland flow conditions and are not appropriate for conventional open channel flow calculations. See Chapter 3, for open channel flow procedures.

Table B-5: Design Storm Frequency Factors for Pervious Area Runoff Coefficients*

Return Period (years)	Design Storm Frequency Factor, X_T
2 to 10	1.0
25	1.1
50	1.2
100	1.25

Reference: Wright-McLaughlin Engineers (1969).

* DUE TO THE INCREASE IN THE DURATION TIME THAT THE PEAK OR NEAR PEAK DISCHARGE RATE IS RELEASED FROM STORMWATER MANAGEMENT SYSTEMS, THE USE OF THESE SHORT DURATION PEAK RATE DISCHARGE ADJUSTMENT FACTORS IS NOT APPROPRIATE FOR FLOOD ROUTING COMPUTATIONS.

Notes:
1) Critical Elevation refers to road overtopping elevation for culverts and top of bank for open channels.
2) Flow taken from Link Maximum Conditions Report (cfs)
3) Stages taken from Node Maximum Conditions Report (ft NGVD)

Notes:
1) Critical Elevation refers to road overtopping elevation for culverts and top of bank for open channels.
2) Flow taken from Link Maximum Conditions Report (cfs)
3) Stages taken from Node Maximum Conditions Report (ft NGVD)

28	-	NM-070	26-22S-32E	-	-	Pond M-1

Notes:

1. The ID numbers associated with each structure are included for the purpose of correlating the structure locations with the system map. (See Fig. 6.1)
2. Detailed structure information for culverts, weirs and drop structures is included in the drainage inventory tables presented in Appendix A.

Notes:
1. Flow represents the peak outflow at the referenced node.
2. Results are from the Bithlo Current Conditions model <EXIST> and the Bithlo Project Conditions model <B-PROJ1>.
3. The simulated storms are all 24-hr duration storms.
4. The LOC ID numbers associated with each location are included for the purpose of cross referencing to the system map (refer to Figure 6.1)

LEGEND
EXISTING CONTOUR
PROPOSED GRADE
STORM SEWER & INLET
LOT GRADING TYPE
FINISH FLOOR ELEVATION
EROSION CONTROL BARRIER
TYPICAL MASS LOT GRADING
TYPICAL LOT GRADING
GENERAL NOTES:
1. ALL FINISH FLOOR ELEVATIONS SHALL BE A MINIMUM OF 8" ABOVE THE HIGHEST GRADE ADJACENT TO BUILDING PAD. FLOOR ELEVATIONS SHOWN ARE BASED ON THE MINIMUM FRONT SETBACK. ALL GRADING TYPE A & B LOT FINISH FLOORS SHALL BE AT LEAST 1.5 FT. ABOVE THE LOWEST ROAD CROWN ALONG LOT FRONTAGE.
2. DRIVEWAYS SHALL NOT EXCEED A SLOPE OF ±14%.
3. MEANDER SWALES AROUND SPECIMEN TREES AND LIMIT DISTURBANCE OF WETLAND VEGETATION TO A MINIMUM.
4. FINISHED FLOOR ELEVATION FOR GRADING TYPE C LOTS IS BASED ON A TWO PERCENT (2%) MINIMUM SLOPE ALONG SEWER SERVICE LATERALS AND AN ADDITIONAL ONE AND ONE HALF FOOT (1.5') FOR FOUNDATION THICKNESS AND PLUMBING STUBOUT.
5. IT WILL BE THE RESPONSIBILITY OF THE BUILDING CONTRACTOR TO INSURE THAT THE CONSTRUCTED SEWER SERVICE LATERAL STUBS CAN BE CONTINUED AT A MINIMUM TWO PERCENT (2%) SLOPE TO MEET THE FINISHED FLOOR ELEVATION CRITERIA FOR GRADING TYPE C LOTS AS DESCRIBED ABOVE. BEFORE ANY BUILDING CONSTRUCTION TAKES PLACE WITHIN A GRADING TYPE C LOT, THE CONTRACTOR MUST VERIFY THE AS-BUILT ELEVATION OF THE CONSTRUCTED SEWER SERVICE LATERAL.
6. THE BUILDING ENVELOPE SHOWN IS THE MAXIMUM AREA ON WHICH A BUILDING CAN COVER FOR EACH LOT. THE BUILDER SHOULD BE SURE TO CHECK LOT SETBACKS FOR EACH BUILDING PRIOR TO CONSTRUCTION.

NOTE: THE HYDRAULIC DATA IS SHOWN FOR INFORMATIONAL PURPOSES ONLY, TO INDICATE THE FLOOD DISCHARGES AND WATER SURFACE ELEVATIONS WHICH MAY BE ANTICIPATED IN ANY GIVEN YEAR. THIS DATA WAS GENERATED USING HIGHLY VARIABLE FACTORS DETERMINED BY A STUDY OF THE WATERSHED. MANY JUDGEMENTS AND ASSUMPTIONS ARE REQUIRED TO ESTABLISH THESE FACTORS. THE RESULTANT HYDRAULIC DATA IS SENSITIVE TO CHANGES, PARTICULARLY OF ANTECEDENT CONDITIONS, URBANIZATION, CHANNELIZATION, AND LAND USE. USERS OF THIS DATA ARE CAUTIONED AGAINST THE ASSUMPTION OF PRECISION WHICH CAN NOT BE ATTAINED. DISCHARGES ARE IN CUBIC FEET PER SECOND AND STAGES ARE IN FEET, NAVD, 1988.

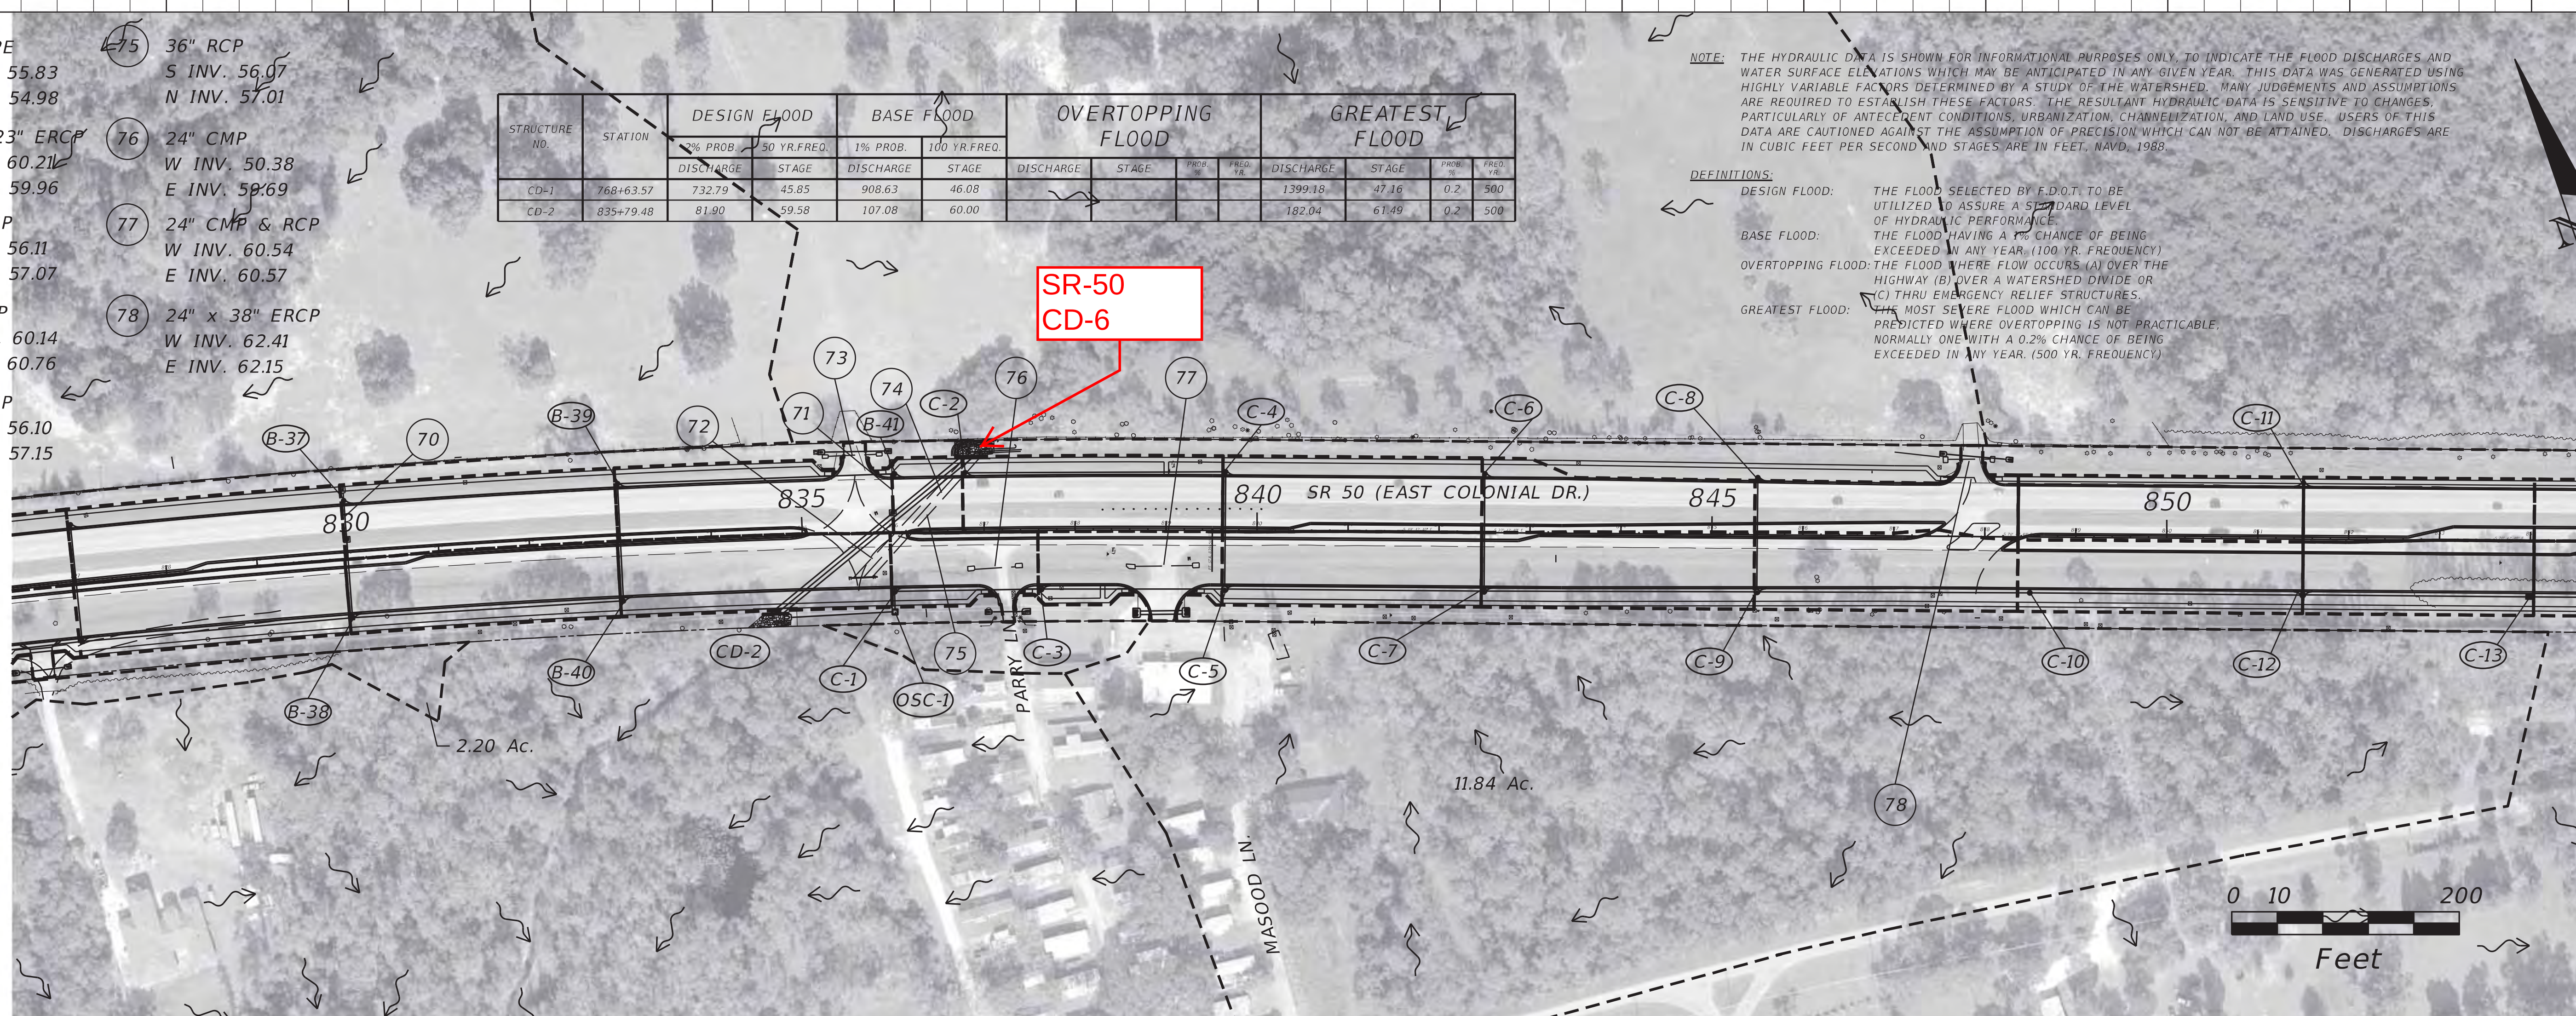
DEFINITIONS:

DESIGN FLOOD: THE FLOOD SELECTED BY F.D.O.T. TO BE UTILIZED TO ASSURE A STANDARD LEVEL OF HYDRAULIC PERFORMANCE.

BASE FLOOD: THE FLOOD HAVING A 1% CHANCE OF BEING EXCEEDED IN ANY YEAR. (100 YR. FREQUENCY)

OVERTOPPING FLOOD: THE FLOOD WHERE FLOW OCCURS (A) OVER THE HIGHWAY (B) OVER A WATERSHED DIVIDE OR (C) THRU EMERGENCY RELIEF STRUCTURES.

GREATEST FLOOD: THE MOST SEVERE FLOOD WHICH CAN BE PREDICTED WHERE OVERTOPPING IS NOT PRACTICABLE, NORMALLY ONE WITH A 0.2% CHANCE OF BEING EXCEEDED IN ANY YEAR. (500 YR. FREQUENCY)



NOTICE: THE OFFICIAL RECORD OF THIS SHEET IS THE ELECTRONIC FILE SIGNED AND SEALED UNDER RULE 61G15-23.003, F.A.C.

STORMWATER MANAGEMENT SYSTEM

1. THE ENTITY THAT WILL OWN, OPERATE, AND MAINTAIN THE STORM SEWER SHOWN ON THESE PLANS IS MATTAMY–JACKSONVILLE PARTNERSHIP. THE CONTRACTOR SHALL BE EXPECTED TO MEET ALL THE REQUIREMENTS OF THE PERMITS OBTAINED.
2. THE CONTRACTOR SHALL PERFORM HIS OWN INVESTIGATIONS AND CALCULATIONS AS NECESSARY TO ASSURE HIMSELF OF EARTHWORK QUANTITIES. THERE IS NO IMPLICATION THAT EARTHWORK BALANCES AND THE CONTRACTOR SHALL BE RESPONSIBLE FOR ANY IMPORT FILL NEEDED, OR FOR REMOVAL AND DISPOSAL OF EXCESS MATERIALS.
3. THE CONTRACTOR SHALL BE RESPONSIBLE FOR OBTAINING THE NECESSARY TESTING TO ASSURE THAT THE PROPER COMPACTION HAS BEEN ACHIEVED ON THE SUBGRADE, BASE, AND ALL OTHER PERTINENT AREAS THAT HAVE BEEN COMPLETED. THE CONTRACTOR SHALL BEAR ALL COSTS ASSOCIATED WITH TESTING AND SHALL PROVIDE THE OWNER AND THE ENGINEER WITH COPIES OF THE CERTIFICATION OF COMPACTION FROM THE TESTING COMPANY.
4. PRIOR TO BID PREPARATION, THE CONTRACTOR MUST BECOME FAMILIAR WITH THE OVERALL SITE CONDITIONS AND PERFORM ADDITIONAL INVESTIGATIONS AS DETERMINED NECESSARY TO UNDERSTAND THE LIMIT AND DEPTH OF EXPECTED ORGANIC SILT PEAT AREAS, ADEQUACY OF EXISTING MATERIALS AS FILL, DEWATERING REQUIREMENTS, CLEAN FILL REQUIRED FROM OFF–SITE AND MATERIALS TO BE DISPOSED OF OFF–SITE, ALL OF WHICH WILL AFFECT HIS PRICING. ANY DELAY, INCONVENIENCE, OR EXPENSE CAUSED TO THE CONTRACTOR DUE TO INADEQUATE INVESTIGATION OF EXISTING CONDITIONS SHALL BE INCIDENTAL TO THE CONTRACT, AND NO EXTRA COMPENSATION WILL BE ALLOWED. THE MATERIALS ANTICIPATED TO BE ENCOUNTERED DURING CONSTRUCTION MAY REQUIRE DRYING PRIOR TO USE AS BACKFILL, AND THE CONTRACTOR MAY HAVE TO IMPORT MATERIALS, AT NO EXTRA COST, FROM OFF–SITE TO MEET THE REQUIREMENTS FOR COMPACTION AND PROPER FILL.
5. IT IS THE CONTRACTOR'S RESPONSIBILITY TO DETERMINE EXISTING SITE CONDITIONS OF SOIL PRIOR TO N.T.P. TO DETERMINE IF ANY OFF–SITE MATERIALS WILL NEED TO BE IMPORTED TO ACHIEVE THE GRADES SPECIFIED ON THE PLANS.
6. THE CONTRACTOR SHALL NOTIFY THE OWNER AND ENGINEER WHEN ALL WORK IS LAID OUT (SURVEY STAKED), SO THAT A DETERMINATION MAY BE MADE OF SPECIFIC TREES TO BE REMOVED. A TREE REMOVAL PERMIT IS REQUIRED TO BE OBTAINED BY THE CONTRACTOR.
7. ALL FILL MATERIALS SHALL BE FREE OF MUCK, STUMPS, ROOTS, BRUSH, VEGETATIVE MATTER, RUBBISH, OR OTHER UNSUITABLE MATTER.
8. ALL MATERIALS EXCAVATED SHALL REMAIN THE PROPERTY OF THE OWNER AND SHALL BE STOCKPILED AT ON–SITE LOCATIONS AS SPECIFIED BY THE OWNER. MATERIALS SHALL BE STOCKPILED SEPARATELY AS TO USEABLE (NONORGANIC) FILL STOCKPILES AND ORGANIC (MUCK) STOCKPILES IF MUCK IS ENCOUNTERED. CONTRACTOR SHALL BE RESPONSIBLE FOR THE REMOVAL OF ALL UNSUITABLE FILL MATERIALS FROM THE SITE.
9. FILL MATERIALS PLACED UNDER ROADWAYS SHALL BE COMPACTED TO AT LEAST 98% MAXIMUM DENSITY AS SPECIFIED IN AASHTO T–180. ALL OTHER AREAS ARE TO BE COMPACTED TO AT LEAST 95% MAXIMUM DENSITY AS SPECIFIED IN AASHTO T–180. FILL MATERIALS SHALL BE PLACED AND COMPACTED IN A MAXIMUM OF 12" LIFTS. REFER TO SOILS REPORT FOR ADDITIONAL INFORMATION. THE CONTRACTOR SHALL PROVIDE THE ENGINEER AND THE OWNER WITH ALL (PASSING AND FAILING) TESTING RESULTS. RESULTS SHALL BE PROVIDED ON A TIMELY AND REGULAR BASIS PRIOR TO CONTRACTOR'S PAY REQUEST SUBMITTAL.
10. GRADING SHOWN ON THESE PLANS IS PROVIDED TO THE CONTRACTOR TO EXPRESS THE GENERAL GRADING INTENT OF THE PROJECT. THE CONTRACTOR SHALL GRADE THE ENTIRE SITE TO PROVIDE POSITIVE DRAINAGE IN ALL AREAS. SMOOTH TRANSITIONS SHALL BE PROVIDED BETWEEN CONTOURS OR SPOT ELEVATIONS AS SHOWN ON THE PLANS TO ACCOMPLISH THE GRADING INTENT. ALL SLOPES SHALL BE STABILIZED IMMEDIATELY AFTER FINAL GRADING HAS BEEN COMPLETED. CONTRACTOR SHALL NOTIFY OWNER AND ENGINEER A MINIMUM OF FORTY–EIGHT(48) HOURS PRIOR TO DEMOBILIZATION OF GRADING EQUIPMENT TO DETERMINE THAT THE GRADING INTENT HAS BEEN ACHIEVED.
11. REINFORCED CONCRETE PIPE (RCP) SHALL BE CLASS III WITH RUBBER GASKET JOINTS. RCP SHALL CONFORM TO FDOT STANDARD SPECIFICATIONS FOR ROAD AND BRIDGE CONSTRUCTION (LATEST EDITION) SECTION 941. RUBBER GASKETS SHALL CONFORM TO SECTION 942.
12. ALL OTHER RELATED ITEMS REQUIRED FOR THE CONSTRUCTION OF THE STORM SEWER (OUTFALL PROTECTION, POLLUTION CONTROL, ETC.) ARE TO BE IN ACCORDANCE WITH DETAILS SHOWN ON THE CONSTRUCTION PLANS, FDOT ROADWAY AND TRAFFIC DESIGN STANDARDS, AND FDOT STANDARD SPECIFICATIONS FOR ROADWAY AND BRIDGE CONSTRUCTION (LATEST EDITION).
13. ALL PIPE CALL OUTS ARE MEASURED CENTERLINE TO CENTERLINE FOR MANHOLES AND INLETS.
14. ALL ON–SITE AREAS DISTURBED BY THE CONSTRUCTION SHALL BE STABILIZED WITH A SEED AND MULCH MIXTURE UNLESS OTHERWISE NOTED.
15. ALL OFF–SITE AREAS DISTURBED BY CONSTRUCTION SHALL BE SODDED WITH BAHIA.
16. FINISHED FLOOR ELEVATIONS ARE 6" ABOVE SOD AT SLAB ON ALL SIDES.
17. MINIMUM GRADE OF SODDED AREA TO BE 1%.
18. COORDINATE WITH LANDSCAPE CONTRACTOR TO ASSURE POND(S) ARE SODDED TO PREVENT SCOURING.
19. F.D.O.T. INDEX NO. 102 AND 103 SHALL BE USED FOR EROSION AND SEDIMENT CONTROL.
20. BOUNDARY AND TOPOGRAPHIC DATA IS BASED ON SURVEY PREPARED BY W.C. ELLIOTT SURVEYING DATED JUNE 29, 2011.
21. FOR SOILS DATA, REFER TO REPORT PREPARED BY NODARSE & ASSOCIATES, INC. DATED JUNE 29, 2011.
22. SITE GRADING, PAVING, AND DRAINAGE MATERIALS AND CONSTRUCTION SHALL CONFORM TO ORANGE COUNTY AND SJRWMD DEVELOPMENT STANDARDS AND SPECIFICATIONS.
23. IT WILL BE THE RESPONSIBILITY OF THE CONTRACTOR(S) TO INSURE THAT ALL REQUIRED PERMITS ARE OBTAINED AND ARE IN HAND PRIOR TO THE COMMENCEMENT OF CONSTRUCTION.
24. THE STORMWATER POND SIDE SLOPES SHALL BE CONSTRUCTED DURING THE EARLY STAGES OF CONSTRUCTION; SIDE SLOPES SHALL BE SODDED AND THE BOTTOM SEEDED. THESE AREAS SHOULD HAVE VEGETATION ADDED AS SOON AS FEASIBLE.

PAVING & DRAINAGE NOTES:

25. SIDEWALKS ARE TO BE CONSTRUCTED THE LENGTH OF FRONTAGE FOR TRACTS A & B AND ALONG HANCOCK LONE PALM ROAD AS PART OF THE INFRASTRUCTURE.
26. THE MINIMUM GRADE FOR THE SUBDIVISION STREETS WITH MIAMI CURB SHALL BE TWENTY–FOUR HUNDREDTHS (.24%) PERCENT.
27. WHERE BERMS ARE PROPOSED, THE DESIGN SHALL BE CERTIFIED BY THE GEOTECHNICAL ENGINEER.
28. ALL ENVIRONMENTAL SWALES WILL BE OWNED AND MAINTAINED BY THE INDIVIDUAL LOT OWNER AND WILL BE CONSTRUCTED WITH THE INFRASTRUCTURE.
29. AN EROSION CONTROL PLAN IS BEING SUBMITTED AND WILL BE APPROVED BY THE COUNTY ENGINEER.
30. THE SIDEWALK AND APRON IN FRONT OF THE DETENTION PONDS & LIFTSTATION ARE 6" THICK AS SHOWN ON PLANS.

SURVEYOR'S NOTES:

1. THE BEARINGS SHOWN HEREON ARE ASSUMED, BASED ON THE NORTH LINE OF THE NORTHWEST 1/4 OF SECTION 24, TOWNSHIP 22 SOUTH, RANGE 31 EAST, BEING N88°21'23"E.

2. SUB-SURFACE INSTALLATIONS OR IMPROVEMENTS SUCH AS UNDERGROUND UTILITIES AND FOUNDATIONS HAVE NOT BEEN LOCATED, UNLESS OTHERWISE SHOWN.

3. DATE OF FIELD SURVEY: MAY 18, 2005

4. THIS PROPERTY IS SUBJECT TO THE FOLLOWING EASEMENTS, ENCUMBERANCES, EXCEPTIONS, RESERVATIONS, RESTRICTIONS, COVENANTS, CONDITIONS, ASSIGNMENTS, ASSESSMENTS, OR AGREEMENTS AS LISTED IN SCHEDULE B, SECTION 2 OF THE FIRST AMERICAN TITLE INSURANCE COMPANY'S COMMITMENT NO. 2037-701759, DATED DECEMBER 17, 2004 AT 8:00 AM, PROVIDED TO THIS SURVEYOR BY THE CLIENT:

(A) EASEMENT TO FLORIDA POWER CORPORATION (DEED BOOK 984, PAGE 364, PUBLIC RECORDS, ORANGE COUNTY, FLORIDA) – POWER LINE IS SHOWN HEREON, HOWEVER, THE EASEMENT IS "BLANKET" IN NATURE AND ONLY LIMITS THE PROPERTY OWNER FROM BUILDING WITHIN 25 FEET OF SAID POWER LINE.

FLOOD NOTE:
BASED UPON MY REVIEW OF THE FEDERAL EMERGENCY MANAGEMENT AGENCY FLOOD INSURANCE RATE MAPS FOR ORANGE COUNTY, FLORIDA, PANEL Nos. 285 AND 295 OF 700, COMMUNITY PANEL Nos. 12095C0285E AND 12095C0295E (RESPECTIVELY), BOTH WITH AN EFFECTIVE DATE OF DECEMBER 6, 2000, THE PROPERTY SHOWN HEREON LIES PARTIALLY WITHIN ZONE X (AREAS DETERMINED TO BE OUTSIDE 500-YEAR FLOOD PLAIN), AND ZONE A (AREAS WITHIN 100-YEAR FLOOD, NO BASE FLOOD ELEVATIONS DETERMINED).

LEGAL DESCRIPTION (From Title Commitment):

The West 300 feet of the East 1/2 of the Southwest 1/4 of the Northwest 1/4, lying south of highway in Section 24, Township 22 South, Range 31 East, Orange County, Florida.

GENERAL NOTES

1. The dimensions and locations of the proposed buildings shown hereon are approximate only. Do not utilize said measurements for building layout. Refer to the Architectural drawings for exact building dimensions.
2. Land surveys, soils reports and legal descriptions were provided by others. The Engineer does not certify to the accuracy or completeness of same. The user of these plans shall verify the accuracy of all said information prior to any construction.
3. Prior to construction the Contractor and owner shall determine the locations of all drinking wells, septic tanks, waterways and other facilities to insure that all minimum setbacks between drainage facilities and all other utilities as required by law are met. All existing potable wells within minimum setback areas between any other utility shall be capped or plugged by a licensed water well contractor in accordance with Rules 400-3 and 17-21.10(4). Florida Ad. Code. DO NOT UTILIZE THESE PLANS FOR CONSTRUCTION PRIOR TO THIS INVESTIGATION.
4. Prior to any construction the Contractor shall verify all aboveground and subsurface site conditions, facilities and utilities. The Contractor shall abide by Fl. Statute 93.240 (Sections 566.101 through 566.111 THE UNDERGROUND FACILITY DAMAGE PREVENTION AND SAFETY ACT (call 1-800-432-4770). The Contractor is responsible for the replacement to as-new condition of any existing facility and utility damaged by him whether or not shown hereon.
5. Prior to construction the Contractor shall obtain permits for all on-site and off-site work required by appropriate agencies.
6. Deviations from this drawing are not permitted without the written consent of Orange County and the Engineer. The Contractor shall notify the Engineer of any discrepancies in the drawings prior to proceeding.
7. No construction is permitted in any Conservation Area or setback.
8. All required fill shall meet the Architect's specifications.
9. The Contractor shall furnish and install all materials and labor required for the construction, testing, inspection and completion of the project.
10. The Contractor shall replace all survey stakes destroyed.
11. It is the intent of this design to conform to all applicable ADA codes and regulations, but the Engineer does not warrant or guarantee same to the user of these plans. The user of these plans shall become familiar with said ADA provisions and add same to this plan as necessary to conform to said codes.

ROAD AND DRAINAGE NOTES

1. All workmanship and materials shall conform to Fla. D.O.T. STANDARD SPECIFICATIONS FOR ROAD AND BRIDGE CONSTRUCTION, 2004 edition and all Orange County Technical Manuals.
2. This drawing shows drainage and grading design to within 5 feet of the building(s) only and specifically excludes designs for structures, retaining walls, waterproofing and ventilation. The Contractor shall coordinate with others to insure that support designs have been completed by other design professionals and that no conflicts exist with any other construction, particularly grading within 5 feet of the buildings.
3. Ponds shall be excavated prior to any other construction, with stormwater runoff directed to them. Over-excavation and burying any debris beneath the pond is prohibited. If dewatering is required the Contractor shall construct settling/percolation ponds on site. Following all other construction, the ponds shall be fine graded and sodded per the plan.
4. EROSION / SEDIMENTATION CONTROL: The Contractor shall supply all erosion / sedimentation barriers (hay bales, silt screens and so forth) to prevent siltation and excess quantities of earth from being transported either by natural drainage or vehicular traffic onto any adjacent properties, streets, storm sewers, waterways, conservation areas and so forth. The Contractor shall clean and restore any areas affected by erosion / sedimentation. Erosion control measures are to be in place at the start of construction and to remain in place until construction is completed. The Contractor is to inspect barriers for damage and maintain as needed.
5. The Contractor shall furnish the Engineer a complete as-built survey performed by a Registered Land Surveyor of all drainage and grading construction within 30 days of construction completion.
6. OPERATION & MAINTENANCE OF THE STORMWATER MANAGEMENT SYSTEM:
   (a) Regularly clean all pipes, weirs and inlets.
   (b) Maintain all design elevations and dimensions in the pond.
   (c) Repair all areas affected by erosion immediately.
   (d) Dry Pond: Mow, clean and power rake the pond bottom regularly.
   (e) Wet Pond: Removal of native vegetation, including cattails is prohibited. Removal includes dredging, the application of herbicides, introduction of grass carp and cutting, Maintenance of the ponds shall include keeping structures free of any obstructions. The maintenance entity should address any questions regarding authorized activities within the wet detention pond to SJRWMD.
7. The Contractor shall remove all existing asphalt, trees being designated as being removed and other debris and dispose of same off site at an approved dumping facility.
8. The Contractor shall stripe the parking lot and install concrete curb stops as indicated hereon.
9. All inlets and grate tops shall be designed and furnished as H-20 load bearing. Grate tops must be traversible by bicycles and pedestrians.
10. The Contractor shall obtain on site piping permits from the Orange County Building Dept. prior to any construction.

Traffic Control Plan:
1. The Permittee shall conduct his operations such that there will be a minimum of interference with or interruption of traffic upon and along the roadway. This applies to both the initial installation and the continuing maintenance and operation of facilities except in emergencies There shall be no interference with or interruption of traffic upon and along the roadway until a maintenance of traffic plan approved by the county.
2. During the installation of the facilities authorized by the Use Permit, the Permittee shall at all times maintain flaggers, signs, lights, flares, barricades, and other safety devices as required by the applicable standards or as the County may reasonably deem necessary to properly protect traffic upon the roadway, and to warn and safeguard the public, work crews or County employees against injury or damage.
3. For work within County Right-of-way, submit a maintenance of traffic plan to Orange County Traffic Department.
